EXPLANATORY NOTES FOR CYCLE FLOW DIAGRAMS

(D-1D-0-2, D-1D-0-3)

These drawings show a chronological flow of PDP-1 from state to state. Time runs from top to bottom of the drawings with a non-linear scale. The true time scale is indicated at the right edge of the cycle zero drawing. All events (changes in the state of the machine) which may be initiated by a particular time pulse, are enclosed by horizontal lines which include that time pulse number at the left of the drawings. Because of the built-in delay of the flip-flops, the state does not change until 0.1 μsec after the start of the initiating pulse. If more than one event is conditioned for a given time pulse, these events occur simultaneously, even though one event may be drawn above another.

Each instruction the machine performs starts with a cycle-zero. This is the memory cycle which brings the instruction from that memory address contained in the Program Counter. Certain instructions (jmp,jsp,opr,shift, skip,law,iot & spc) are completed in this memory cycle. Shift may overlap the next cycle-zero (or break cycle one) but this is of no interest to the programmer unless he is operating the machine "single step".

All two cycle instructions proceed from cycle-zero to cycle-one unless a deferred (indirect) address is called for. In the later case, one or more defer cycles occur between cycle-zero & cycle-one. The one cycle instructions, jmp & jsp may also include defer cycles.

The instruction Execute (xct) is changed in the early part of its cycle-one to cycle-zero of the instruction to be executed. Thus Execute may take two or three cycles depending upon the instruction executed. Both the Execute instruction and the instruction executed may include defer cycles.

At the completion of each instruction, a sequence break may occur. This break consists of break cycle one, two & three.

ABBREVIATIONS:

AC	Accumulator
BC	Break cycle counter
BREAK CODER	A network whose output is four times the number of the sequence which has priority.
carry	The second step of a two step add
cyc	cycle ff
df 1	a ff which indicates a defer cycle is or <u>is to be</u> performed
df 2	a ff which indicates a second defer cycle is to be performed
dis shift	a special shift left at Ac & IO $AC_0 \rightarrow AC$ $AC \xrightarrow{C} IO_{17}$ (see notation)
ff	flip-flop
IO	In Out Register
ioh	a ff indicating an in out halt is in progress
IR	Instruction Register (5 bits)
MA	Memory Address Register
MB	Memory Buffer Register
Mi	Memory inhibit ff
Mr	Memory read ff
Mus Shift	Shift right of AC & IO. $AC_0 \rightarrow AC$ $\curvearrowright_0 \rightarrow AC$ IO_{17} dropped
mw	Memory write ff
pad	The first step of a two step add (xor of MB & AC)
PC	Program Counter
run	a ff which connects time pulse 10 to TP zero
SBS	Sequence Break System
Sh/Ro	Perform a shift or rotate step

NOTATION:

0 → AC	clear AC
C → AC	complement the AC
+1 → AC	Add one (count) to the AC
PC —1→ MA	put the one of PC in MA
MB —0→ AC	put the zeros of MB in AC'
AC —∪→ MB	AC jam to MB ie put ones & zeros
MB —1 (6-17)→ AC	put the ones of MB bits 6 thru 17 to AC bits 6 - 17
AC1	bit number 1 of the AC
