TITLE 8A100,205,405,425,625 FIELD INSTALLATION ACCEPTANCE PROCEDURE

I. GENERAL

Installation of the basic 8A100,205,405,425 and 625 computer requires no special tools or equipment. Normal hand tools are all that are required.

II. UNPACKING

Unpack and inspect the equipment using the procedure provided in the Operator's Handbook.

III. INSPECTION

After removing the equipment packing material, inspect the equipment.

1. Inspect the external surface of the chassis for surface, bezel, switch and light damage.
2. Internally inspect the 8A enclosure and console for damage, loose nuts, bolts, screws, etc.
3. Inventory all hardware against shipping list.
4. Inventory all software against software list, if ordered.
5. Inventory all prints against shipping list if ordered.

IV. INSTALLATION PROCEDURE

Install the equipment using the following procedure:

1. Turn off the power switch of the Limited Function Console.

WARNING

DO NOT TOUCH THE COMPUTER AFTER PLUGGING IT IN UNTIL IT IS CHECKED FOR THE PROPER GROUNDING.

2. Insure that all power is received from the same source.
3. Plug in the power cord.

4. Before touching the computer, check frame to ground to insure that no AC voltage is present.
5. Unplug power cord.
6. Turn "on" Power ON/OFF switch and set regulator circuit breaker to the "ON" position. (Behind the Limited Function Console on the 8A100, 8A205, and 8A405 or inside the rear panel on the 8A425 and 8A625.)
7. Repeat Steps 3 and 4.
8. Power should now be applied to the 8A; fans should be running, and the power light on the Limited Function Console should be "ON". The light labeled 'battery charging' should be illuminated on the 8A425 and 8A625 indicating that DC power is okay.

   If none of the above occur, remove the Limited Function panel and check the Master/Slave switch located below the ON/OFF switch on the Limited Function Board.

9. The Run light should not be on. If it is, switch Power Off via the ON/OFF switch.

   Remove the M8315 CPU module (on all except 8A625) and set switches as indicated below. Then insert CPU in the first slot in the OMNIBUS and turn power back on. The Run light should remain off.

   S1-1 thru S1-6, S1-8 set to "OFF" position.
   S1-7 set to "ON" position.

10. Check modules to insure they are located in their proper position in the OMNIBUS. Refer to the Operator's Handbook.
11. Check the operation of the Programmer's Console.
12. Manually load, deposit and examine to insure that memory modules are associated with the correct memory fields. If not, turn the unit off and reconfigure the memory modules to the correct fields.

NOTE ALL I/O XFERS TAKE PLACE OVER THE DATA LINES.

IN REALITY ALL XFERS TAKE PLACE ON THE LEADING EDGE OF BUS STB IN ACCORDANCE WITH THE "C" LINES AT THAT TIME.
ASSERTING NOT LAST XFER CAUSES THE CPU TO WAIT FOR A BUS STROBE TO DO THE NEXT XFER
THE CPU WILL NOT ADVANCE TO TS4 UNTIL IT SEES A BUS STROBE WITH NOT LAST XFER NEGATED - THIS IN TURN CAUSES INTERRUPT STROBE.

LINK LOAD SHOULD BE GIVEN IN SYNC WITH BUS STROBE AND CAUSES LINK DATA TO GO TO THE LINK.

I GENERAL

This procedure defines the performance standards required of the KM8A*, option board #2. This procedure refers to both system and add-on acceptance.

NOTE: If KM8A was shipped as part of a PDP-8A system, then proceed to installation procedure.

* Memory Extension & Time Share
Bootstrap Loaders
Power Fail/Auto Restart

II INSPECTION

After removing the KM8A from the packing material, inspect the module for the following:

1. Inventory hardware against shipping list.
2. Inventory software against software list, if ordered.
3. Inventory prints against shipping list, if ordered.
4. Check module for loose or broken components.

III INSTALLATION PROCEDURE

Install the equipment using the following procedure:

1. Set the switches as indicated by the diagnostic write up.

NOTE: Refer to Operator's Handbook for switch setting descriptions.

2. Insure that the PDP-8A power is removed from the Omnibus™.

3. Insert the KM8A into the second or third slot of the Omnibus™.

4. Turn the power back "ON".

IV ACCEPTANCE PROCEDURE

Perform the acceptance procedure defined in Table A. If abnormal indications are encountered, refer to the diagnostic listing for the type of error. Reference the diagnostic write ups and Operator's Manual for instructions for loading diagnostics.

IV ACCEPTANCE PROCEDURE (continued)

Equipment required:

1. PDP-8A with 1K min. R/W Memory
2. Paper Tape Input Device
3. Diagnostic and Listings
4. Programmer's Console (KC8-A & DKC8-A)
5. W987 Quad Extender

NOTE: If the programmer's console and paper tape input device are not available as part of the system being used, they must be supplied in good working order by the customer.

1. Introduction

This document describes the organization of the two 256 x 4 ROMs, hereafter called ROM #1 and ROM #2, that control and supply data for the Auto-Restart and Bootstrap portions of Option Board #2.

This information is made available to help users program their own ROMs for their specific Auto-Restart and/or Bootstrap program(s).

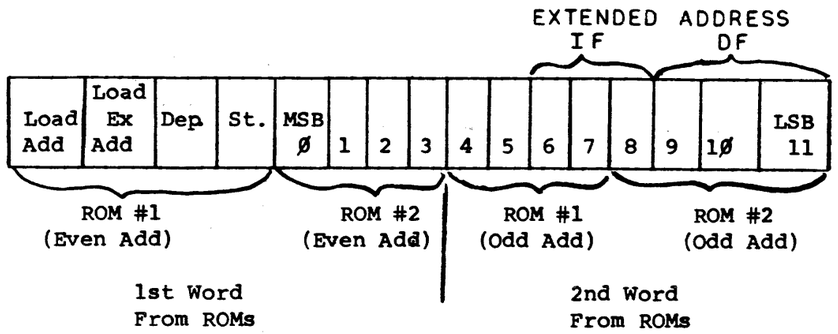
2. Organization

The two ROMs are connected as follows: the address lines are connected in parallel; i.e., two corresponding address lines of each ROM are connected together, the outputs are arranged in serial fashion forming an 8 bit word, 4 outputs from each ROM. Because 12 bits are required for data/address information, two sequential addresses must be accessed from the ROMs to form a 16 bit word. Where the first 8 bits are temporarily stored in a register, then the next 8 bits are accessed from the ROMs. At this point the control then decides what to do with 12 of the 16 bits. There are four possible actions that can take place at this time:

a) Load Address
b) Load Extended Address, IF AND DF
c) Deposit
d) Start

The remaining 4 bits of the 16 actually tell the control which of the four actions are to take place. So the 16 bit word would look like the word in Figure 1.

Figure 1



The use of ROMs that have 256 addressable locations allows up to 128 words of ROM storage. These 128 locations may be used for Bootstrap and/or Auto-restart programs. Any Auto-restart or Bootstrap program may be located anywhere in the ROMs so long as the program starts in an even address in the ROM. If it is required that both Bootstrap and Auto-restart programs be accessible at the same time, activated by different signals; of course the Auto-restart program(s) must be located in addresses Ø through 15 in the ROMs. This is due to the addressing limits of the Auto-restart select switches.

3. Auto-Restart/Bootstrap Sequence

The following events should take place when an auto-restart is initiated:

a) Load a 12 bit address
b) LOAD THE IF AND DF AND START.

The following events should take place when the Bootstrap is initiated:

a) Load a 12 bit initial address.
b) Load the IF AND DF
c) Deposit 12 bit data words repeating as required by length of program to be deposited.
d) Load a 12 bit starting address and start.

The decision to do a Bootstrap or an auto-restart is directed by a set of switches on the module. The Bootstrap may be actuated by the transition of the signal AC Low from a logic low to a logic high or by a similar transition of the SW line on the OMNIBUS.

AN AUTO-RESTART MAY ONLY BE INITIATED BY THE AC LOW SIGNAL. IT SHOULD BE OBVIOUS THAT BOTH THE BOOTSTRAP OR AUTO-RESTART SHOULD NOT BE ACTIVATED BY THE SAME INITIALIZING SIGNAL.

4. ROM Programming Examples

Auto-restart example:

a) Load address Ø2ØØ
b) Load field Ø, start

Starting at ROM address ØØ4

Bootstrap example:

a) Load address ØØ23
b) Load field 7 (BOTH IF AND DF)
c) Deposit 2ØØØ
d) Deposit 6745
e) Deposit ØØ23
f) Deposit 765Ø
h) Deposit 5Ø24
j) Deposit 6733
k) Deposit 5Ø31
l) Load address ØØ24 and start

Starting at ROM address 124.

Auto-Restart example:

Bit / Add	ROM #1 4	3	2	1	ROM #2 4	3	2	1	
4	1	0	0	0	0	0	0	0	Load Address Ø2ØØ

TITLE FIELD INSTALLATION & ACCEPTANCE PROCEDURE FOR DKC8-A

I GENERAL

This procedure defines the performance standard required of the DKC8*, option board #1. This procedure refers to both system acceptance and add-on acceptance.

NOTE: If DKC8 was shipped as part of a PDP-8A system, proceed to installation procedure.

* Serial Line Unit
Real Time Clock
Parallel I/O
Programmer's Console Logic

II INSPECTION

After removing the DKC8 from the packing material, inspect the module for the following:

1. Inventory hardware against shipping list.
2. Inventory software against software list, if ordered.
3. Inventory prints against shipping list, if ordered.
4. Check hardware for loose or broken components.

III INSTALLATION PROCEDURE

Install the equipment using the following procedure:

1. Set up switches as indicated by the diagnostic write up.

S1-1 thru S1-3	"ON"	9600 baud
S1-4	"ON"	Normally "ON"
S1-5	"ON"	Real Time Clock Enable
S1-6	"ON"	Normally "ON"
S1-7	"ON"	One Stop Bit
S1-8	"OFF"	Disable TTY 20 MA Filter

NOTE: Reference Operator's Handbook for switch setting descriptions.

2. Insert TTY loop back cable (DEC Part #7008517) on DKC8.

3. Insert parallel I/O cable loop back cable (DEC Part # BC08R-1) on DKC8.

TITLE KT8A FIELD INSTALLATION AND ACCEPTANCE PROCEDURE

I General

This document will define the hardware requirements and tests to be preformed to: #1) install, #2) configure and #3) accept a KT8-AA system or KT8-AB add-on to an existing system.

Because the KT8-A Memory Management options has several possible hardaware configurations, the Hardware Rules/Restrictions (appendix A), General Configuration Guide (appendix B) and Configuration Examples (appendix C) should be referenced before installing this option.

A. If the KT8-AA was shipped as part of a system, refer only to the Acceptance procedure.

B. If the KT8-AB is an add-on installation to upgrade an existing system, then refer to the Installation and Acceptance Procedures.

II Hardware

This section defines the required hardware to install and accept a KT8-A and also defines the three hardware designations of the KT8-A option.

A. The KT can be installed and accepted on any 8A/420 or 620 machine.

B. The KC8A Programmer's Console is not required, as the KT diagnostics have a console package.

C. Program loading media is via: Paper tape, Floppy, or RK05.

D. The Three designations of the KT are as follows:

1. KT8A-A - the KT Memory Management option shipped as part of a system configured by a DEC Manufacturing facility.

2. KT8A-B - the required hardware to upgrade an 8A/420 or 8A/620 system. The KM8-AC (M8317YB or YC) is part of this option.

TITLE KT8A FIELD INSTALLATION AND ACCEPTANCE PROCEDURE

3. KT8-EX - this option is required any time the memories are located is two seperate boxes (BA8C's). If required as part of an add-on, both the KT8-AB and KT8-EX must be ordered as seperate line items.

III Installation

Before proceding with your installation refer to Appendix A and B to familarize yourself with the rules and configurations. Also refer to the configuration example that most represents your particular installation.

1. Install all memory in the system, refer to Congiguration guide (appendix B).

2. Install the KT8-AB in any vacant OMNIBUS slot with an "E" connector.

3. If the system is comprised of two (2) BA8C boxes and memory will be located in each box than install the M9020, terminator module, in any available "E" connector of the box not containing the KT8-A (M8416). Now connect the cable (70-11411-1J) between the two berg connectors of the M8416 and M9020.

IV Acceptance

The time to accept a KT8-A configuration depends upon the amount of memory installed.

1. Load and run the KT8-A Memory Management Diagnostic, Maindec 08-DJKTA-A, for five min. with NO errors.

2. Load and run the Extended Address Test Maindec 08-DHKMC-C, for one pass with NO errors.

3. Load and run the Extended Memory Data and Checkerboard Test, Maindec 08-DHKMA-D, for one pass with NO errors.

4. To insure system integrity, load and build a DEC/X8 program using version 2, which will exercise up to 128K of memory. It is important that the program is build using the latest DEC/X8 modules.

NOTE: Reference should be made to the latest write-up for DEC/X8 (version 2) as further parameters must be inputted to support break devices.

APPENDIX A

HARDWARE RULES/RESTRICTIONS

1. Any OMNIBUS CPU (KK8A or KK8F) using a BA8C box (20 slot box) is acceptable.
2. The KT6-A system can only be configured using any combination of MM8AB (16K core) and MS8C (16K or 32K MOS) memories.

   NOTE: MM8AA, MR8A, MS8A, MM8E, MM8EJ and MR8F memories cannot be used to configured a KT8A system.
3. If the system is made up of MM8AB core memories (16K), then they must be modified per ECO MM8AB #7, refer to table 1 for instructions.
4. If the system is made up of MS8C type memories (16Kor 32K MOS), them refer to table 2 for switch configuration.
5. The PDP/8E chassis cannot be used as part of a KT8-A system.
6. If Power Fail/Auto Restart and/or Bootstraps are required as part of the system, then a KM8-AC (M8317YB or YC) must be used with the Memory Extension and Timeshare option disabled via the jumper configuration in table 3.

   NOTE: The M8317 and M8317YA are incompatable with the KT8A system.

APPENDIX B

General Configuration Rules

1. All memories must be physically located in the OMNIBUS where an "E" connector is present.
2. Remembering the above rule, place the memories as far away as posible from the CPU.
3. Direct Memory Address interfaces can only be located between the CPU and the first memory element. With one exception, in a two box system (2 BA8C's) where memory is located in both boxes a DMA interface may be located in any vacant slot of the box containing the CPU.
4. Programmed I/O interfaces may be located in any vacant slot of the system.
5. When memories are located in two BA8C chassis then the KT8-EX option must be used to extend the memory management option bank bits. The M9020 terminator card must be located in an "E" connector of the BA8C not containing the M8416. The 70-11411-1J cable is then connected between the M9020 and the M8416.

APPENDIX C

Configration Examples

Because the KT8-A is limited to use in the BA8C chassis (20 slot box) there are only four possible configurations.

1. The entire system located in one BA8C with a KK8A CPU as shown below.

TITLE MS8C Field Installation and Acceptance Procedure

I. General

This procedure defines the performance standards required of the MS8CA and MS8CB Memories. The MS8C can be installed in any PDP8A series computers. The Memory may be an add-on to PDP8E systems if a BA8C expander is used.

II. Inspection Add-on

After removing the M8417 from the packing material, inspect the module for the following:

1. Loose or broken components.
2. Inventory against shipping lists.

III. Installation

1. Switch/Field Selection

MS8-CA (1)One switch(only)must be off.
MS8-CB (2)Two switch(only)must be off.

Set-up switch as defined in the following table. Switchs off are the enable.

	Address	Bank	Field
S1-1	0-16K	0	0-3
S1-2	16-32K	0	4-7
*S1-3	32-48K	1	0-3
*S1-4	48-64K	1	4-7
*S1-5	64-80K	2	0-3
*S1-6	80-96K	2	4-7
*S1-7	96-112K	3	0-3
*S1-8	112-128K	3	4-7

*NOTE: KT8A must be installed for these settings. Refer to the KT8A Installation and Acceptance Procedures for KT8A systems acceptance.

2. Install

Ensure power to PDP8A is off.
Insert the M8417 into slot 4 of the PDP8A.
If two memories are to be installed, install the second in slot 5.

IV. Acceptance

Preform the acceptance test as indicated in the following table. If problems are encountered, refer to the diagnostic listings for the type of error and for information on how to read the error printouts.

ENGINEERING SPECIFICATION [redacted] CONTINUATION SHEET

1. Shipping Hardware

   1.1 See A-PL-MR8-F-5 (Shipping List)

2. Shipping Software

   2.1 See A-PL-MR8-F-6 (Software List)
   NOTE: Prom Diagnostics are not used in this Acceptance Procedure. These Maindecs are used to diagnose the MR8-FB after the MR8-FB has been programmed to the customers specifications.

3. Equipment required for acceptance

   3.1 PDP8E, 8M, or 8A with a programmers console. If 4K of read/write memory is present, the system must have a KM8-E (M837), or KM8-A (M8317), extended memory control. All these options must be customer supplied.

4. Unpacking and Installation

   4.1 Unpack and inspect the modules for physical damage.

   4.2 Make sure all four top edge connectors on the M8349 are fitted correctly.

   4.3 Turn power off in the PDP8E, 8M, 8F, or 8A.

   4.4 If the MR8-FB is a PDP8E, 8F, or 8M, add-on remove M8330 and insert the new M8330-YB in the same slot. The MR8-FB requires an M8330-YB inorder to operate.

   4.5 Insert the M8349 in the OMNIBUS behind the RFI shield (M849) in the PDP8E, 8F, or 8M, and in the lowest available Omnibus slot in the PDP8A.

   4.6 Remove or disable all other options in PDP8E, 8M, 8F, or 8A that use the "SW" or "BOOT" switch option.

5. Acceptance

5.1 The MR8-FB is shipped with Prom Internal test Maindec-08-DHMRE programmed in the Prom chips.

5.2 Turn PDP8E, 8M, 8F, or 8A, power on.

5.3 If the MR8-FB is an add-on and an M8330-YB was installed, run all basic 8E diagnostics and EAE diagnostics if applicable.

5.4 Toggle "SW" or "BOOT" switch. The Prom Internal Test should be running. Refer to MAINDEC-08-DHMRE writeup if there are any errors. With the switch register = ØØØØ the test will halt in approx. 3 min. Repeat the test 4 times.

5.5 If no errors have occurred the MR8-FB is ready to be erased and reprogrammed by the customer.

NOTES:

1. JUMPERS IN FOR Ø OUT FOR 1
2. DIODES ON OUTPUT OF INVERTERS ARE IN FOR 1
   DIODES ON INPUT OF INVERTERS ARE IN FOR Ø
   SOME DIODES ARE INSTALLED IN PRODUCTION TO FACILITATE CHECKOUT. A CUSTOMER WILL RE-ARRANGE DIODES TO HIS REQUIREMENTS
3. DELAY OUTPUT IS ADJUSTED TO 2 2 S + 50 NS.
4. DIODES AND JUMFERS SHOWN IN DOTTED LINES ARE NOT PUT ON THE BOARD DURING MANUFACTURE. THEY ARE ADDED DURING CHECKOUT AS REQUIRED. SOLID LINE JUMPERS ARE PUT IN WHEN BOARD IS ASSEMBLED.
5. UNLESS OTHER WISE NOTED RESISTANCE IS IN OHMS 1/4W 5%.
6. YA1 JUMPER (ROM ADDRESS) IS ONLY INSTALLED IF THE PROM ADDRESSES OVERLAY CORE MEMORY ADDRESSES.
7. UNLESS OTHER WISE SPECIFIED ALL DELAY TIMES ARE ± 20%.

II INSPECTION

After removing the MS8A from packing material, inspect the module for the following:

1. Check for loose or broken components.
2. Inventory software against software list, if ordered.
3. Inventory prints against shipping list, if ordered.
4. Inventory hardware against shipping list.

III INSTALLATION PROCEDURE

Install the equipment using the following procedure:

1. Set up switches as indicated below for the particular variation being accepted.
