DEFINITIONS
Number of digits, including high-order zeros, in dividend
Dp Number of digits, including high-order zeros, in the field at the P address.
Dq Number of digits, including high-order zeros, in the field at the $Q$ address.
$\mathrm{Dq}^{\mathbf{1}}$ Number of digits, including high-order zeros, in the $Q$ part of the instruction.
Dv Number of digits, including high-order zeros, in the divisor.
Dz Number of digits compored until a digit other than zero is detected in either field.
IX Index Register.
Number of digits in mantissa.
Number of digits mantissa is increased by shift left.
Core storage location defined by $P$ address.
Length of index register field.
Number of zeros in mantisso
Milliseconds.
Number of digits, including high-order zeros, in quotient.
Number of disk sectors.
Position number of octal table entry addressed. Average octal number is 3.5.
$\mu \mathrm{sec}$ Microseconds.
$\mathrm{Z}_{q} \quad$ Number of zeros in field ot $Q$ (multiplier).

* Time CPU is interlocked.
- Special feature.

## NOTES

1. Indirect Addressing. Indicates that the $P$ and/or $Q$ address can $(Y)$ or cannot $(N)$ be an indirect address.
2. Index Modification. Indicates that the $\mathbf{P}$ and/or the Q address can $(\mathrm{Y})$ or cannot ( N ) be modified by on index register.
3. If there is no change of sign of the $P$ data, the basic time formula is used. If the sign of the $P$ dato changes, recomplement time is added to basic time.
The $Q$ address is not used.
The $P$ address is not used.
The next instruction executed is at the $P$ address.
If the branch does not occur, the next sequential instruction is executed.
The $P$ address is the location of the disk control field.
For computation of instruction time, assume that the average octal digit equals 3.5.
For computation of instruction time, assume that the average quotient digit value equals 4.5 .

## Storage Register Functions

R-1 Contains address of next instruction if machine is stopped with Stop key Contains address of next instruction if machine is stopped with Stop
or Holt instruction. Saves return address when interrupt is serviced or Halt instruction. Sa
( 1710 Control System)

IR-2 Saves return address when any branch and transmit instruction is executed in Mainline program.

IR-3 Contains interrupt addess - used in ploce of IR-I during interrupt program operation (1710 Control System only).

IR-4 Saves return address when any Branch and Transmit instruction is executed in the Interrupt Program (1710 Control System only).

OR-1 Contains $Q$ addess after I cycles of on instruction. In disk storoge operations, used to store and control disk sector address.

OR-2 Contains $P$ address after $I$ cycles of an instruction. In disk storage operarions contains core storoge address where data from disk storage is written to or read from.
OR-3 Retains oddress of low-order multiplier digit during multiplication.
OR-4 Used to store and control the exponent address $E_{q}$ during automatic floatingpoint operations.
OR-5 Used to store and control the exponent address $E_{p}$ during automatic floatingpoint operations.
PR-1 Saves return address when a Save key operation occurs. Decremented for each new multiplier digit during multiply.
PR-2 Decremented for each new multiplicand digit during multiply. In disk storage operations, used to store and control number of sectors in operation.

MAR Addresses core storoge.
MBR Receives digits leaving core storoge.
MIR Receives digits entering core storage.
OP Contains Op code of instruction just executed if mochine is stopped with Stop key or Hait instruction.

CR-1 Used to store the algebraic difference between $E_{p}$ and $E_{q}$ for determination of decimal alignment during automatic flooting-point operations. CR-1 is also used during floating-point operations to count high-order zeros when normalizing - the contents of CR-1 are subtracted from $E_{p}$.
Multiplier/ Contains multiplier and quotient digits during multiply and automatic Quotient divide operations.
Data Decodes $Q_{8}$ and $Q_{9}$ digits of $B 1, B N I$, and $1 / O$ instructions.
Register Stores portial product digits during multiply instructions. Stores Stores portial product digits during multiply instructions. Stores
digits affecting MARS during all I cycles. Stores one of the digits used in any addition or subtraction.

NOTE: Figures in parenthesis are (left) positive and negative numeric characters and (right) positive and negative alphabetic characters that correspond to the associated plotting movement.

NOTES
1 Writing on disk storage is in numeric mode only．
2 Output only；no input is provided．
3 Can be 0 or 12－0 for input；punched 0 for output．
Input operations and Dump Numeric only．For EOL is phamerically and Write Numerically， provided on the typewriter or printer．

Input／output characters are separated by slash．
6 Can be X or CXO for input．
