## Network Control Program Emulation Program

# **Reference Summary and Data Areas Volume 2**

NCP Version 7 Release 2 EP Release 12

Before using this document, read the general information under "Notices" on page xix.

### **Tenth Edition (October 1994)**

This licensed document applies to the following IBM licensed programs:

- · Advanced Communications Function for Network Control Program Version 7 Release 2 (program number 5648-063).
- Emulation Program for IBM Communication Controllers (program number 5735-XXB) Release 12.

Publications are not stocked at the address given below. If you want more IBM publications, ask your IBM representative or write to the IBM branch office serving your locality.

A form for your comments is provided at the back of this document. If the form has been removed, you may address comments to:

## **Notices**

The licensed programs described in this document and all licensed material available for them are provided by IBM under terms of the IBM Customer Agreement. Changes are made periodically to the information herein; before you use this document in connection with the operation of IBM systems, consult the latest IBM System/370, 30xx, 4300, and 9370 Processors Bibliography,

Any reference to an IBM licensed program or other IBM product in this licensed document is not intended to state or imply that only IBM's program or other IBM products may be used.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send inquiries, in writing, to:

IBM Director of Licensing International Business Machines Corporation 500 Columbus Avenue Thornwood, New York, 10594, U.S.A.

References in this publication to IBM products, programs, or services do not imply that IBM intends to make them available in all countries in which IBM operates.

This document is not intended for production use and is furnished as is without any warranty of any kind, and all warranties are hereby disclaimed including the warranties of merchantability and fitness for a particular purpose.

## **Programming Interface Information**

This publication is intended to help the customer to do diagnosis of the Advanced Communication Function for Network Control Program (NCP) and Emulation Program for IBM Communication Controller (EP). This publication documents information which is Diagnosis, Modification, or Tuning information provided by NCP and EP.

Warning: Do not use this Diagnosis, Modification, or Tuning information as a programming interface.

## **About This Book**

This section contains the following information:

- Who should use this book
- · How to use this book
- IBM 3745-130, 3745-150, 3745-160, and 3745-170 Communication Controllers
- How "IBM special products or user-written code" is used
- How "CSS," "37CS," and "3746 Model 900" are used
- What is new in this book
- · Where to find more information.

This book provides reference information about Version 7 Release 2 of the Advanced Communications Function for Network Control Program (NCP); Release 12 of the Emulation Program for IBM Communication Controllers (EP), and the Partitioned Emulation Program (PEP) Extension.

#### Who Should Use This Book

This book is for system programmers and IBM program support representatives who are responsible for diagnosing and debugging problems.

#### **How to Use This Book**

This book consists of 2 volumes containing NCP reference information.

Volume 1 contains the data area formats. Volume 2 contains detailed reference information about the flow of data and commands through the functional components of NCP and EP and the flow control mechanisms used by NCP and EP.

## How "MVS", "VM", and "VSE" Are Used

The term *MVS* means the MVS/XA\*, and MVS/ESA\* systems. The term *VM* means the VM/ESA\* system in the CMS environment. The term *VSE* means the VSE/SP, and VSE/ESA\* operating systems.

#### How IBM 3745 Communication Controller Model Numbers Are Used

In this book, the term *IBM 3745 Communication Controller* refers to all IBM 3745 models. When particular models are discussed, the appropriate model numbers are specified. Model numbers include IBM 3745-130, 3745-150, 3745-160, 3745-170, 3745-17A, 3745-210, 3745-21A, 3745-31A, 3745-410, 3745-610, and 3745-61A.

## How "Ethernet-Type LAN" Is Used

The term *Ethernet-type LAN* means a local area network (LAN) that uses either the Ethernet Version 2 or IEEE 802.3 protocol.

## How "IBM Special Products or User-Written Code" is Used

This book sometimes refers to IBM special products or user-written code. This phrase means IBM special products such as Network Terminal Option (NTO), Network Routing Facility (NRF), and X.25 Packet Switching Interface (NPSI), or user-written code.

## How "CSS", "37CS", and "3746 Model 900" Are Used

The terms connectivity subsystem (CSS) and 37CS refer to the 3746 Model 900 connectivity subsystem, an expansion frame that extends the connectivity and enhances the performance of the IBM 3745 Communication Controller.

## How "Token-ring" Is Used

NCP can connect to an IBM Token-ring Network using the NCP/Token-ring interconnection (NTRI) or the 3746 Model 900 connectivity subsystem attachment. This book uses the term token-ring when referring to either type of connection.

## How "Frame-relay" Is Used

To support frame-relay networks, NCP can use a transmission subsystem (TSS) or high performance transmission subsystem (HPTSS) adapter on the 3745, or NCP can use a communication line processor (CLP) adapter on the 3746 Model 900 connectivity subsystem. Unless otherwise stated, this book uses the term frame-relay when referring to a 3745 or a 3746 Model 900 connection.

### How "NCP V7R2" Is Used

In this book, unless otherwise specified, the term NCP V7R2 refers to NCP Version 7 Release 2 with or without the optional NCP Feature for 3746 Model 900 connectivity subsystem support. To use this feature, you must have the 3746 Model 900 installed in your controller.

#### What is New in This Book

This edition contains information on new NCP and EP functions, as well as editorial, organizational, and technical changes. New or changed technical information is identified by a vertical bar (|) in the left margin.

NCP V7R2 and EP R12 offers the following enhancements:

- 3746 Model 900 Frame-relay
- Spare SDLC Lines
- Frame-relay Communications Rate Enhancement

## Supported Releases

Table 0-1 on page xxiii shows the releases of NCP and EP that are currently supported by IBM. If you need information on an unsupported release of NCP or EP, refer to an earlier edition of this book.

Table 0-1. Supported Releases of NCP and EP

| Product | Release | Operating Systems |
|---------|---------|-------------------|
| NCP     | V4R1    | VSE               |
|         | V4R2    | MVS, VM           |
|         | V4R3.1  | MVS, VM, VSE      |
|         | V5R3    | VSE               |
|         | V5R4    | MVS, VM, VSE      |
|         | V6R1    | MVS, VM           |
|         | V6R2    | MVS, VM           |
|         | V6R3    | MVS               |
|         | V7R1    | MVS, VM, VSE      |
|         | V7R2    | MVS               |
| EP      | R3      | VSE               |
|         | R4      | MVS, VM           |
|         | R6.1    | MVS, VM, VSE      |
|         | R7      | VSE               |
|         | R8      | MVS, VM, VSE      |
|         | R9      | MVS, VM, VSE      |
|         | R10     | MVS, VM           |
|         | R11     | MVS, VM           |
|         | R12     | MVS, VM, VSE      |
|         |         |                   |

## **Monitoring and Tuning NCP**

With the following new products, you can monitor and tune NCP while it is running in the communication controller:

- · The NTune Monitoring Facility uses online panels and messages to display the current status of various NCP resources and identify network problems. The NTune Monitoring Facility runs under the NetView\* program in the host and interacts directly with any NCP activated by VTAM.
- The NTune Tuning Facility enables you to enhance NCP performance by changing various NCP parameters while NCP is running. The NTune Tuning Facility runs in the controller along with NCP and functions in conjunction with the NTune Monitoring Facility.

For more information about these products, refer to NTune User's Guide and NTuneNCP Reference.

### Where to Find More Information

The NCP, SSP, and EP library, available in hardcopy and softcopy form, contains information on a wide variety of tasks related to these products. This section introduces the library, as well as other sources of information that will aid you in performing these tasks.

#### A Good Place to Start

A good place to start any task regarding NCP, SSP, or EP is NCP V7R2, SSP V4R2, and EP R12 Library Directory. This directory introduces the enhancements for the current release and shows where these enhancements are described in the NCP library. It gives you an overview of NCP, SSP, and EP and directs you to information on a variety of tasks related to these programs. When you are using the book online, you can use hypertext links1 to move directly from task and enhancement descriptions to the appropriate chapters of other books in the library.

## Information for NCP Tasks

The books in the NCP, SSP, and EP library are listed here according to task, along with closely related books and tools you may find helpful. See "Bibliography" on page X-13 for brief summaries of each book in the NCP, SSP, and EP library and listings of related publications.

Table 0-2. Sources of Information by Task

#### D Available on diskette for the IBM OS/2 environment.

Those publications available as softcopy books have cross-document search and hypertext links for speedy, online information retrieval. These softcopy books are grouped together on an electronic bookshelf and are part of the IBM Networking Systems Softcopy Collection Kit on compact disc read-only memory (CD-ROM).

<sup>1</sup> A hypertext link is a pointer from a location in an online book to another location in the same book or another book. By selecting highlighted information, such as a message number, you can move quickly to related information and, if desired, back again.

"Restricted Materials of IBM" Licensed Materials - Property of IBM

You can view and search softcopy books by using BookManager\* READ products or by using the IBM Library Reader\* product included on CD-ROM. For more information on CD-ROMs and softcopy books, see IBM Online Libraries: Softcopy Collection Kit User's Guide and BookManager READ documentation. and the control of the section for the may and setting groups, and bear a<mark>gainst action</mark> to the control of the control of

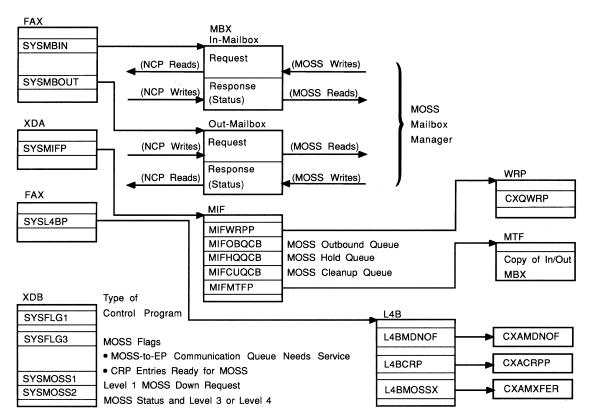

Figure 2-29. MOSS Control Block Relationships

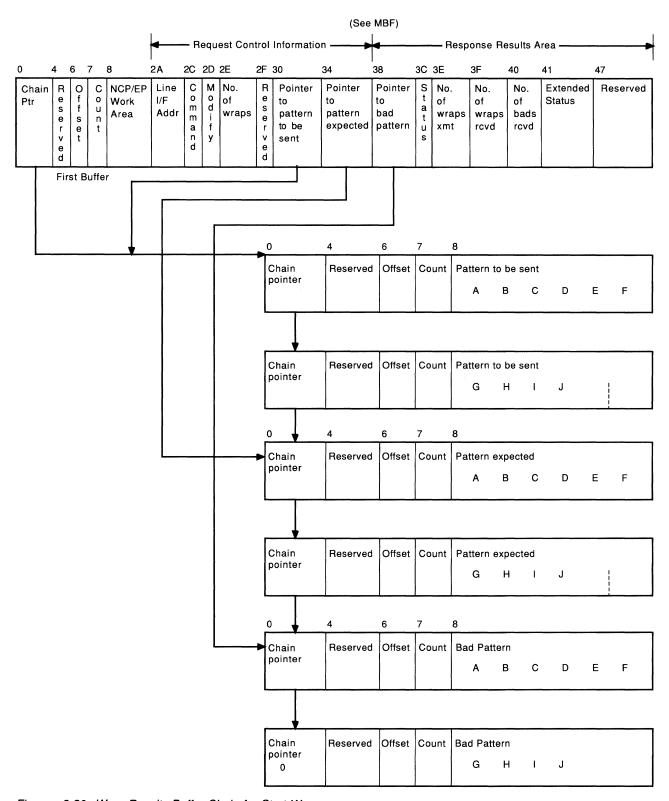

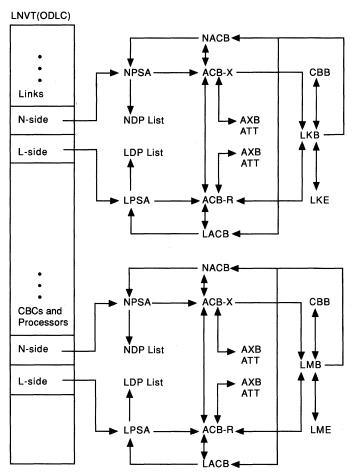

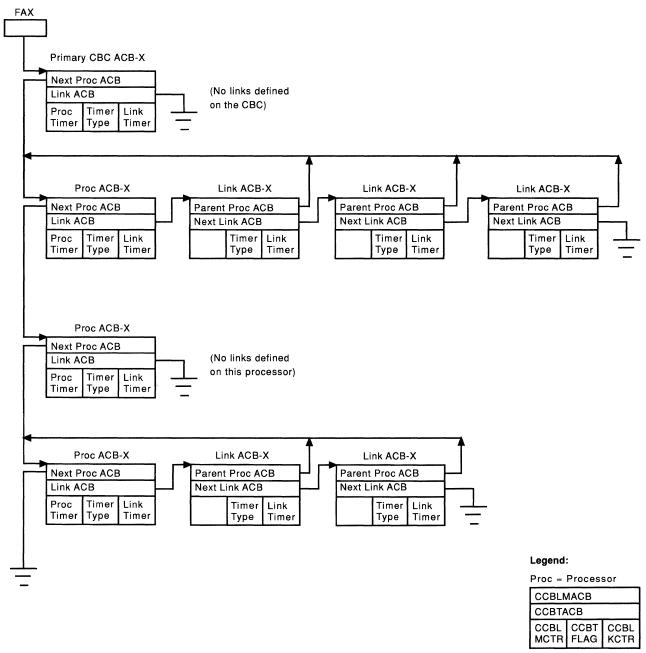

Figure 2-30. Wrap Results Buffer Chain for Start Wrap

Note: There is a pointer from each ODLC link's ACB-X to its processor's ACB-X.

Figure 2-31. ODLC Link, CBC, and Processor Representations

See Figure 2-5 on page 2-6 for an example of SDLC timer chain pointers.

Figure 2-32. NCP ODLC Timer Chain Pointers

**ODLC ESCA Control Block Relationship:** ESCA logical lines are represented as half-duplex leased secondary SDLC links. There will be one ACB and an NACB/LACB pair for each logical line. The logical NACB and LACB will each have a shortened form of the NACB and LACB used for physical lines. ESCA logical lines will also have a LKB and LKE. ESCA physical lines will have a transmit ACB/receive ACB pair and an NACB/LACB pair.

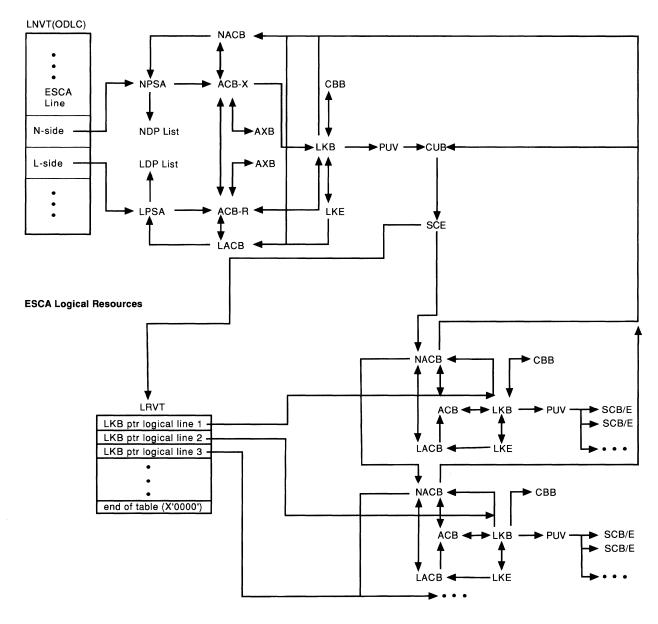

ESCA logical stations will be represented as stations on leased secondary SDLC links. There will be an SCB/CUB and SCE for each logical station.

The control block linkage for the logical control blocks will be the same as for the physical control blocks, with these exceptions:

- Each logical NACB will have a pointer to the next NACB in the active logical line list. An NACB is added to the list when it is activated and removed from the list when it is deactivated.
- The physical CUB (which represents the PU for the physical line) contains a pointer to the active logical line list.
- Each logical NACB contains a pointer to the physical NACB.
- Each logical NACB contains a pointer to the physical CUB.
- Each logical NACB contains a pointer to the NPSA for the associated physical line (at the same offset as the NPSA pointer in the physical NACB).
- Each logical LACB contains a pointer to the LPSA for the associated physical line (at the same offset as the LPSA pointer in the physical LACB).

Figure 2-33 on page 2-33 summarizes the resource control block relationship.

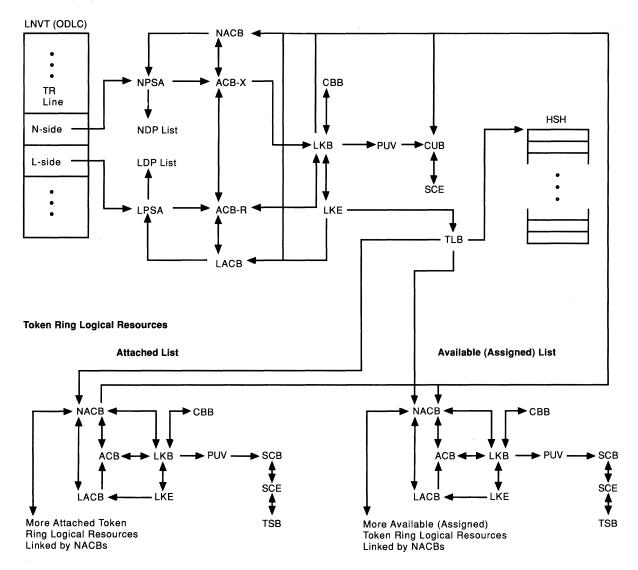

## **ESCA Physical Resources**

Note: Each logical NACB has a pointer to the physical NPSA Each SCE (logical and physical) has a pointer to its associated LACB

Figure 2-33. Control Block Structure for ESCA Physical/Logical Resources

## **Token Ring Physical Resource**

Note: Each logical NACB has a pointer to the physical NACB and to the physical CUB and the physical NPSA Each SCE (logical and physical) has a pointer to its associated LACB

Figure 2-34. Control Block Structure for Token-Ring Physical/Logical Resources

This figure lists selected control block pointers. The fields may point to different control blocks at different times. Each row below lists a field, the control block in which the field is located, all of the possible control blocks to which the field may point, and, most importantly, under which conditions the field will point to that specific control block. Listed under the conditions is the appropriate bits which need to be tested to make that condition true.

For a pictorial layout of these pointers, see Figure 2-36 on page 2-37 through Figure 2-44 on page 2-41.

| CONTROL | .========  | .=========== |  |
|---------|------------|--------------|--|
| BLOCK   | FIELD      | POINTS TO:   | CONDITIONS   |
| LNVT    | LNVTPSAP/R | PSA          | DEFINED LINE AND NOT IN USE BY EP. (LNVTFLGS BIT 1 OFF) (LNVTFLGS BIT 7 OFF)   |
| LNVT    | LNVTPSAP   | EPCCB        | DEFINED LINE AND IN USE BY EP. (LNVTFLGS BIT 1 OFF) (LNVTFLGS BIT 7 ON) THE EPCCB CONTAINS THE PSA.  |
|         | ·          | DUMMY PSA    | UNDEFINED LINE OR LINE INTERFACE (HDX lines) (LNVTFLGS BIT 1 ON)   |
| CONTROL | =========  |              |  |
| BLOCK   | FIELD      | POINTS TO:   | CONDITIONS   |
|         | PSAACBP    |              | IN USE BY EP. (LNVTFLGS BIT 7 ON)  |
| PSA     | PSAACBP    | GCB          | NEO.<br>(GCBFLAGS OR CCBSETYP BIT 6 ON)  |

# Section 3. BTU Commands, Modifiers, and Responses

Following is a list of the BTU commands with a brief description of each modifier and the hexadecimal value.

# Null Command (X'00')

No modifier fields apply to the Null command.

## Read Command (X'01')

| Modifier<br>(hex) | Command                              | Meaning  |  |  |  |  |
|-------------------|--------------------------------------|--|--|--|--|--|
| 00                | Read Normal (R)                      | Unit of data for this command is that specified by the TERMINAL definition statement at NCP generation.                          |  |  |  |  |
| 01                | Read Block (Rb)                      | Unit of data for this command is the block. Ends with the End of Block character (EOB).  |  |  |  |  |
| 02                | Read Message (Rm)                    | Unit of data for this command is the message. For BSC, ends with End of Text (ETX). For SS, ends with End of Transmission (EOT). |  |  |  |  |
| 03                | Read Transmission (Rt)               | Unit of data for this command is the transmission (ends with EOT).   |  |  |  |  |
| 04                | Read Transmission<br>Disconnect (Rd) | Command is executed as a Read Transmission command followed by a Disconnect command.   |  |  |  |  |
| 05                | Read with Invite (Ri)                | Command is executed as a Read Transmission command with Disconnect followed by an Invite Normal command.                         |  |  |  |  |

## Write Command (X'02')

| Modifier<br>(hex) | Command                                 | Meaning  |  |  |  |  |
|-------------------|---|--|--|--|--|--|
| 00                | Write Normal (W)                        | Unit of data is one block.   |  |  |  |  |
| 01                | Write with End of Message (Wm)          | Unit of data is one block followed by the appropriate control sequence or character for an End of Message (EOM). |  |  |  |  |
| 02                | Write with End of<br>Transmission (Wt)  | Unit of data is one block followed by the control sequence for End of Transmission (EOT).                        |  |  |  |  |
| 03                | Write with Disconnect (Wd)              | Command is executed as a Write Transmission command followed by a Disconnect command.                            |  |  |  |  |
| 06                | Write with Read (implied EOT) (Wr)      | Command is executed as a Write command followed by a Read command.   |  |  |  |  |
| 07                | Write with Invite (Wi)                  | Command is executed as a Write command with an EOT followed by a Disconnect command and then an Invite command.  |  |  |  |  |
| 08                | Write with Contact* (Wc)                | Command is executed as a Contact command followed by a Write Normal command.                                     |  |  |  |  |
| 09                | Write with Contact* (implied ETX) (Wcm) | Command is executed as a Contact command followed by a Write with EOM.   |  |  |  |  |

| Modifier (hex) | Command  | Meaning  Command is executed as a Contact command followed by a Write with EOT.                          |  |  |  |  |
|----------------|--|--|--|--|--|--|
| 0A             | Write with Contact* (implied EOT) (Wct)                              |  |  |  |  |  |
| 0B             | Write with Contact* and<br>Disconnect (implied ETX and<br>EOT) (Wcd) | Command is executed as a Contact command followed by a Write with EOT followed by a Disconnect command.  |  |  |  |  |
| 0E             | Write with Contact* and Read (Wcr)                                   | Command is executed as a Contact command followed by a Write with EOT followed by a Read Normal command. |  |  |  |  |

<sup>\*</sup> Contact may not begin a telephone connection to a BSC call-in device.

# Test Command (X'03')

Note: These commands are sent in the request unit of an FiD1 execute test request.

| Modifier<br>(hex) | Command                                       | Meaning Command tests a device.                                      |  |  |  |  |
|-------------------|---|--|--|--|--|--|
| 00                | Test Device Normal (T)                        |  |  |  |  |  |
| 01                | Test Device with Contact (Tc)                 | Command establishes a session with the device to be tested.          |  |  |  |  |
| 02                | Test Device with Disconnect (Td)              | Command ends a session with the device to be tested.                 |  |  |  |  |
| 03                | Test Device with Contact and Disconnect (Tcd) | Command establishes and ends a session with the device to be tested. |  |  |  |  |
| 04                | Test Line Normal (TI)                         | Command tests a line.  |  |  |  |  |
| 05                | Test Line with Contact (Tlc)                  | Command establishes a session with the line to be tested.            |  |  |  |  |
| 06                | Test Line with Disconnect (Tld)               | Command ends a session with the line to be tested.                   |  |  |  |  |
| 07                | Test Line with Contact and Disconnect (Tlcd)  | Command establishes and ends a session with the line to be tested.   |  |  |  |  |

# Invite Command (X'05')

| Modifier<br>(hex) | Command                                  | Meaning  |  |  |  |  |
|-------------------|--|--|--|--|--|--|
| 00                | Invite Normal (I)                        | Unit of data for this command is that specified by the TERMINAL definition statement at NCP generation.                              |  |  |  |  |
| 01                | Invite Block (lb)                        | Unit of data for this command is the block. Ends with the End of Block character (EOB).  |  |  |  |  |
| 02                | Invite Message (Im)                      | Unit of data for this command is the message. For BSC, ends with End of Text (ETX). For SS, ends with End of Transmission (EOT).     |  |  |  |  |
| 03                | Invite Transmission (It)                 | Unit of data for this command is the transmission (ends with EOT).   |  |  |  |  |
| 04                | Invite Transmission with Disconnect (Id) | Command is executed as an Invite Transmission command followed by a Disconnect command.  |  |  |  |  |
| 05                | Invite with Auto Restart (Ia)            | Command is executed as an unbounded series of Invite with Disconnect commands. This command must be terminated with a Reset request. |  |  |  |  |

| Modifier<br>(hex) | Command   | Meaning   |  |  |  |
|-------------------|---|---|--|--|--|
| 06                | Invite Perpetual (valid only for clusters) (lp) | Command is executed as an unbounded series of Invite Transmission commands with no intervening Disconnect commands. |  |  |  |

# Contact Command (X'06')

| Modifier<br>(hex) | Command                            | Meaning  |
|-------------------|------------------------------------|--|
| 00                | Contact Normal                     | Contact is normal.   |
| 01                | Contact with Return<br>Resource ID | Command returns the resource ID of the line used to establish the dial connection. |

# **Disconnect Command (X'07')**

| Modifier<br>(hex) | Command                              | Meaning   |  |  |
|-------------------|--------------------------------------|---|--|--|
| 00                | Disconnect Normal (D)                | No modifier   |  |  |
| 01                | Disconnect with Invite (Di)          | Command is executed as a Disconnect Normal command followed by an Invite Normal command.  |  |  |
| 02                | Disconnect with EOC (De)             | For switched lines, this modifier results in the physical connection between the terminal and the communications controller being broken. For all other lines, this modifier is the same as normal. |  |  |
| 03                | Disconnect with EOC and Invite (Dei) | Command is executed as a Disconnect with End of Call (EOC) followed by an Invite command.   |  |  |

# Control Command (X'08')

| Modifier<br>(hex) | Command   | Meaning  |  |  |  |  |
|-------------------|---|--|--|--|--|--|
| 01                | Display Line Status                               | Command displays the current status of the line.   |  |  |  |  |
| 02                | Replace Session Initiation Information for a Line | Command replaces line control block (LCB) information associated with the initiation.  |  |  |  |  |
| 05                | Copy Session Initiation Information               | Command accesses information associated with the initiation of a session.  |  |  |  |  |
| 12                | Change Modem Speed                                | Command allows the user to change the speed at which the appropriate modems operate a line.  |  |  |  |  |
| 14                | LPDA Test Interrupt                               | Command starts the link problem determination aid (LPDA) test when the line goes from busy to idle. (This command is internal to NCP.) |  |  |  |  |
| 18                | Copy Destination Mode                             | Command accesses the mode information of a device from the device base control block (DVB).  |  |  |  |  |
| 1C                | Physical Disconnect                               | Command breaks the physical dial connection.   |  |  |  |  |
| 21                | Copy Device Session Information                   | Command accesses the device's polling characters, addressing characters, and, if the devices is switched callout, the dial digits.     |  |  |  |  |

| Modifier<br>(hex) | Command                                 | Meaning   |  |  |  |  |
|-------------------|---|---|--|--|--|--|
| 22                | Replace Device Session<br>Information   | Command replaces the device's polling characters and addressing characters in the DVB control block. If the device is switched callout, it replaces the dial digits in the callout control block extension (COE). |  |  |  |  |
| 23                | Set Session Address                     | Command transfers the use of a BSC/SS device to another SSCP.   |  |  |  |  |
| 41                | Reset Error Lock                        | Command clears the error lock condition on a device. The first request on the device work queue is honored at the completion of this command.   |  |  |  |  |
| 42                | Reset Device Queues                     | Command returns all commands for a device that were accepted but have not yet been honored. The response BTU of the returned commands indicates that they were reset.   |  |  |  |  |
| 43                | Request Control Mode Reset              | Command sends Reverse Interrupt (RVI) on BSC lines.   |  |  |  |  |
| 44                | Reset Immediate                         | Command ends the current operation on a device without regard to data loss.   |  |  |  |  |
| 48                | Reset Online Terminal Test              | Command aborts the execution of the chain of Online Terminal Tests (OLTTs), tests the diagnostic mode, and clears the device queues.  |  |  |  |  |
|                   |   | <b>Note:</b> This command is sent in the request unit of an FID1 Execute Test request.  |  |  |  |  |
| 4A                | Switch to Backup                        | Command requests switched line backup.  |  |  |  |  |
| 4C                | Switch from Backup to<br>Primary        | Command requests that the primary line be activated.  |  |  |  |  |
| 50                | Reset Conditional                       | Command tests the status of the top command for a device. If data transfer has not started, the reset takes place immediately. If data transfer has started, the reset is not done.                               |  |  |  |  |
| 60                | Reset at End of Command                 | Command ensures that the device input queue and device work queue are idle and empty so a new sequence of operations can begin.   |  |  |  |  |
| 8D                | Modify Block Handler Set<br>Association | Command activates, deactivates, and changes the association of a block handler set (BHS) with a device.   |  |  |  |  |
| 9A                | Set Destination Mode                    | Command replaces the device mode flags for a particular device.   |  |  |  |  |
| E3                | Override Session Address                | Command reestablishes contact with the owning SSCP.   |  |  |  |  |

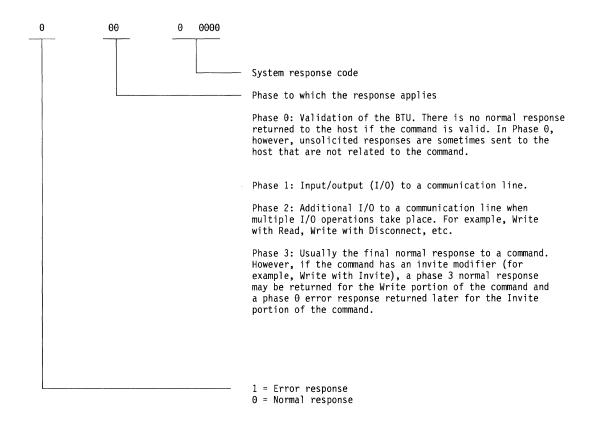

## **Unsolicited Response (X'77')**

This section list the responses that are returned to the host in the BTU. The response contains 2 bytes:

- System response (BCUSRES)
- Extended response (BCULRES). Extended response is also referred to as the line response.

## **System Response Byte**

The system response byte has the following format:

# **Summary of BTU Responses**

Note: Phase 0 error responses can be returned for any portion of a BTU on which there is a validity error.

| Command<br>and<br>Modifier                                    | Phase<br>0<br>Error | Phase<br>1<br>Error | Phase<br>1<br>Normal | Phase<br>2<br>Error | Phase<br>2<br>Normal | Phase<br>3<br>Normal |
|---|---------------------|---------------------|----------------------|---------------------|----------------------|----------------------|
| Invite Normal (I)   | Any part            | ı                   | i                    |                     |                      | l(final)             |

| Invite Transmission (It)                                      | Any part            | I                   | 1                    |                     |                      | lt                   |
| Invite Transmission with Disconnect (Id)                      | Any part            | I                   | 1                    | D                   |                      | ld                   |
| Invite with Auto Restart (Ia)                                 | Any part            | I                   | l                    | D                   |                      | la                   |
| Invite Perpetual (Ip)   | Any part            | I                   | I or R               |                     |                      | It or Rt             |
| Disconnect Normal (D)   | Any part            | D                   |                      |                     |                      | D                    |
| Disconnect with EOC (De)                                      | Any part            | D                   |                      |                     |                      | De                   |
| Disconnect with Invite (Di)                                   | Any part            | D/I                 | l                    |                     |                      | D/I (final)          |
| Disconnect with EOC and Invite (Dei)                          | Any part            | D/I                 |                      |                     |                      | D/I (final)          |
| Write Normal (W)  | Any part            | W                   |                      |                     |                      | W                    |
| Write with EOM (Wm)   | Any part            | W                   |                      |                     |                      | Wm                   |
| Write with EOT (Wt)   | Any part            | W                   |                      | Wt                  |                      | Wt                   |
| Write with Disconnect (Wd)                                    | Any part            | W                   |                      | D                   |                      | Wd                   |
| Write with Invite (Wi)  | Any part            | W/I                 | l                    | D                   |                      | Wd (final)           |
| Write with Read (implied EOT) (Wr)                            | Any part            | W                   |                      | Wt/R                | Wt/R                 | R (final)            |
| Write with Contact (Wc)                                       | Any part            | C/W                 |                      |                     |                      | Wc                   |
| Write with Contact (implied ETX) (Wcm)                        | Any part            | C/W                 |                      |                     |                      | Wcm                  |
| Write with Contact (implied EOT) (Wct)                        | Any part            | C/W                 |                      | Wt                  |                      | Wct                  |
| Write with Contact and Disconnect (implied ETX and EOT) (Wcd) | Any part            | C/W                 |                      | D                   |                      | Wcd                  |
| Write with Contact and Read (Wcr)                             | Any part            | C/W                 |                      | Wt/R                | Wt/R                 | R (final)            |
| Read Normal (R)   | Any part            | R                   | R                    |                     |                      | R (final)            |
| Read Block (Rb)   | Any Part            | R                   |                      |                     |                      | R (final)            |
| Read Message (Rm)   | Any part            | R                   | R                    |                     |                      | Rm                   |
| Read Transmission (Rt)  | Any part            | R                   | R                    |                     |                      | Rt                   |
| Read Transmission Disconnect (Rd)                             | Any part            | R                   | R                    | D                   |                      | Rd                   |
| Read with Invite (Ri)   | Any part            | R/I                 | R/I                  | D                   |                      | Rd/I (final)         |
| Contact (C)   | Any part            | С                   |                      |                     |                      | С                    |

#### Notes:

- 1. See Section 3, "BTU Commands, Modifiers, and Responses," for the meanings and symbols for the commands and modifiers.
- 2. Explanation of the chart using the "Write with Contact and Read" command and modifier:
  - Phase 0 error—"Any part" means the error can occur during the Contact, Write with EOT, or Read. See "Phase 0 Error Responses" on page 3-7 for details.
  - Phase 1 error—C/W means the error can occur during Contact or Write with EOT. See "Phase 1, 2, and 3 Error Responses" on page 3-8 for details.
  - Phase 2 error—Wt/R means the error can occur during Write with EOT or Read. See "Phase 1, 2, and 3 Error Responses" on page 3-8 for details.
  - Phase 2 normal—Wt/R means the normal response can occur during Write with EOT or Read. See "Phase 1, 2, and 3 Normal Responses" on page 3-9 for details.
  - Phase 3 normal—response during Read. See "Phase 1, 2, and 3 Normal Responses" on page 3-9 for details.
- 3. Diagnostic aid example using the Write with Disconnect command and modifier: X'02 03 A0' example.

| <b>Phase</b> | 0 | <b>Error</b> | Res | ponses |
|--------------|---|--------------|-----|--------|
|--------------|---|--------------|-----|--------|

| Response | Meaning   |
|----------|---|
| X'81'    | Invalid resource ID   |
| X'82'    | Invalid command   |
| X'83'    | Invalid modifier  |
| X'84'    | Reset of Deactivate is in progress.   |
| X'85'    | Device is inactive.   |
| X'86'    | Line is inactive.   |
| X'87'    | Command is not valid for the resource.  |
| X'88'    | Command syntax error  |
| X'89'    | Command was rejected because it did not conform to BSC specifications.                  |
| X'8A'    | Invalid control data length   |
| X'8B'    | Reset was not performed.  |
| X'8C'    | Data is not resident in storage.  |
| X'8D'    | Dial set queue limit has been reached.  |
| X'8E'    | Line and device incompatibility on switched callout                                     |
| X'8F'    | Invalid test length   |
| X'91'    | Invalid control data  |
| X'92'    | Incomplete BTU  |
| X'93'    | Command was rejected because of an error on one or more of the devices.                 |
| X'94'    | Data is in use.   |
| X'95'    | Invalid Control command modifier, or the Control command is not valid for the resource. |
| X'96'    | Online Terminal Test (OLTT) command was rejected; the queue is not empty.               |

| Response | Meaning  |
|----------|--|
| X'97'    | Online Terminal (OLT) is active; the non-OLT command was rejected.   |
| X'98'    | Multiple dial requests   |
| X'99'    | Mode inconsistency. (A request was made to alter the mode of a resource, but the resource was already in that mode.) |
| X'9A'    | Buffers required to complete the operation are not available; system is in slowdown mode.                            |
| X'9B'    | Command was rejected; system is in auto network shutdown (ANS).  |
| X'9C'    | Command was rejected; error lock set.  |
| 9D       | Command was rejected; the resource is not available.   |
| 9E       | Command was rejected; line deactivated or command reset.   |
| 9F       | See "Conditional Extended Responses" on page 3-12.   |

# **Phase 0 Unsolicited Responses**

| Response | Meaning   |  |
|----------|---|--|
| X'00'    | Invalid bit configuration   |  |
| X'02'    | Control mode reset, End of Transmission (EOT) not received        |  |
| X,03,    | Device association is completed.                                  |  |
| X'04'    | Multiple terminal access (MTA) device is identified.              |  |
| X'0A'    | RECMS records accompany the BTU.                                  |  |
| X'0B'    | Route extension failure occurred.                                 |  |
| X,0C,    | Override session address is received.                             |  |
| X'0D'    | Gateway node was generated.                                       |  |
| X'1A'    | Link was forced into deactivation.                                |  |
| X'1D'    | PLU-device session was terminated by auto network shutdown (ANS). |  |
| X'1E'    | Serviceability aid—host logging                                   |  |

# Phase 1, 2, and 3 Error Responses

| Phase 1<br>Response | Phase 2<br>Response | Phase 3<br>Response | Meaning  |
|---------------------|---------------------|---------------------|--|
| A0                  | C0                  | E0                  | Data check   |
| A1                  | C1                  | E1                  | Possible intervention required   |
| A2                  | C2                  | E2                  | Intervention required  |
| A3                  | СЗ                  | E3                  | Negative poll limit reached—WAIT option                                  |
| A4                  | C4                  | E4                  | Yielded to contention  |
| A5                  | C5                  | E5                  | Device error—BSC status pending  |
| A6                  | C6                  | E6                  | ID Error   |
| A7                  | C7                  | E7                  | Line trace terminated due to error                                       |
| A8                  | C8                  | E8                  | Test command or Reset Online Terminal Test command processing terminated |

| Phase 1<br>Response | Phase 2<br>Response | Phase 3<br>Response | Meaning   |
|---------------------|---------------------|---------------------|---|
| <b>A</b> 9          | C9                  | E9                  | Session not started due to hardware error                 |
| AA                  | CA                  | EA                  | BSC error status message                                  |
| AB                  | СВ                  | EB                  | General poll operation aborted due to error               |
| AC                  |                     |                     | Fanout backup limit exceeded                              |
|                     | CC                  | EC                  | Disconnected  |
| B3                  | D3                  | F3                  | Break received on this block                              |
| B8                  | D8                  | F8                  | Contact rejected—session started                          |
| B9                  | D9                  | F9                  | Dial data inconsistency                                   |
| BA                  | DA                  | FA                  | Buffers required to complete operation are not available. |
| BE                  | DE                  | FE                  | Command rejected, line deactivated or command reset       |
|                     |                     | FF                  | Invalid address   |

# Phase 1, 2, and 3 Normal Responses

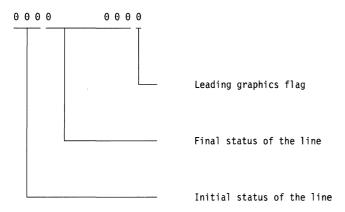

| Phase 1<br>Response | Phase 2<br>Response | Phase 3<br>Response | Meaning  |
|---------------------|---------------------|---------------------|--|
| 20                  | 40                  | 60                  | Command executed OK this far (pertains to all commands not represented by 22, 42, or 62)   |
| 21                  | 41                  | 61                  | Leading graphics received  |
| 22                  | 42                  | 62                  | One of the following commands executed OK this far:  |
|                     |                     |                     | <ul> <li>Read or Invite</li> <li>Write (in conversational mode)</li> <li>Write with Read or Write with Contact and Read (WCR) commands in the read phase.</li> </ul> |
| 23                  | 43                  | 63                  | Negative poll limit reached—QUEUE option (NCP generation)  |
| 24                  | 44                  | 64                  | Online Terminal Test (OLTT) request message  |
| 25                  | 45                  | 65                  | BSC status message   |
| 26                  | 46                  | 66                  | Negative poll limit reached—NOWAIT option (NCP generation)   |
| 27                  | 47                  | 67                  | Line trace output  |

The following responses occur when the line is in monitor mode:

| Response | Meaning  |
|----------|--|
| X'EC'    | Disconnect received                                |
| X'ED'    | IPL required                                       |
| X'EE'    | Permanent trunk error                              |
| X'EF'    | Block from the gueue caused an abnormal condition. |

## **Extended Response Byte**

The extended response byte contains either a normal extended response or a conditional extended response. The normal extended response appears in both BCULRES and the second byte of IOBSTAT. It has the following format:

A conditional extended response applies to one specific system response and does not have a fixed format. It appears only in BCULRES. The following extended response definitions apply only if an input/output operation is involved.

## **Extended Responses**

#### **Initial Status**

| 000 | Control mode                     |
|-----|----------------------------------|
| 001 | Text mode                        |
| 010 | Transparent text mode (BSC only) |
| 011 | Heading mode (BSC only)          |
| 100 | Special                          |
| 111 | Hardware/user error              |

#### Normal Final Status when Initial Status=Control, Text, Transparent Text, or Heading

| 0 000. | Time-out. One or more characters have been received, but may not be stored (control mode).            |
|--------|---|
| 0 010. | Cutoff. This bit indicates that a controlled length field (for example, an ID field) was too long and |
|        | was cut off at the end of the correct length.   |
| 0 011. | Reply to transmitted data was an Enquiry (ENQ); transmission is aborted.                              |
| 0 100. | An End of Transmission (EOT) was received on a block that began without a Start of Text (STX),        |
|        | Start of Header (SOH), or circle D; text was received in control mode.                                |
| 0 101. | End of Data Link Escape (DLE) control (BSC only)  |
| 0 110. | Wrong Acknowledgment (ACK). ACK1 was received when ACK0 was expected, or ACK0 was                     |
|        | received when ACK1 was expected.  |
| 0.111. | For start-stop, Negative Acknowledgment (NAK) returned in response to a selection, poll, write, or    |
|        | NAK reply to text.  |
|        | For BSC, an EOT returned in response to a selection, poll, or write.                                  |
| 1 000. | Received sub-block  |
| 1 001. | End of text (ETX)   |
| 1 010. | End of block (EOB)  |
| 1 011. | Data or leading graphics received with an ENQ, or ENQ by itself                                       |
| 1 100. | EOT received with no errors   |
| 1 101. | Reverse Interrupt (RVI)   |
| 1 110. | Positive ACK returned and no errors indicated on a write operation                                    |

...1 111. Weak Acknowledgment (WACK) received (could be an error condition)

#### Final Status when Initial Status=Special

| 0 000. | Time-out with nothing received  |
|--------|---|
| 0 001. | Command reject (a should-not-occur error) set by the communications scanner code  |
| 0 010. | Level-2 and level-3 buffer pools are depleted; level 4 may still have buffers left. When this bit is on, data is lost.  |
| 0 011. | Selected (BSC tributary only), or modem test in progress, or a valid Auto Speed Detect line speed was not found. (TWX only. This status is found in IOBSTAT only. BCULRES will reflect "disconnected.") |
| 0 100. | Received disconnect signal on TWX or DLE/EOT on BSC   |
| 0 101. | Data was received when it was not expected.   |
| 0 110. | A reset occurred.   |
| 0 111. | The device has been polled, or a valid Auto Speed Detect line speed was found. (TWX only. This status is found in IOBSTAT only. BCULRES will reflect "connected.")                                      |
| 1 000. | Transmitted sub-block   |
| 1 001. | An EOT was sent after a specified number of WACKs were received in response to a request or operation.  |
| 1 010. | Received break in text (two consecutive stop-bit errors). The last 2 characters stored are invalid. They may be incorrect length control characters or all spaces.                                      |
| 1 011. | Polling stop. Device was polled to the polling limit and responded negatively, or a Read Initial with a single polling modifier was directed to a polled line.  |
| 1 100. | EOT transmitted   |
| 1 101. | Received a break signal while transmitting  |
| 1 110. | Disconnected  |
| 1 111. | Connected   |
|        |   |

#### Final Status when Initial Status=Hardware/User Error

| 0 | 000. | User error normally indicates an incorrect NCP generation.  |
|---|------|---|
| 0 | 001. | Clear to Send (CTS) dropped during a transmit operation.  |
| 0 | 010. | Backup timer expired because a scanner was down or the line was automatically reset because the       |
|   |      | scanner was down.   |
| 0 | 011. | SDLC transmit underrun limit exhausted  |
| 0 | 100. | Communications line adapter check. Occurs whenever a level-2 interrupt (not dependent on an           |
|   |      | external source) is expected and not received. For example, after starting to transmit, a level-2     |
|   |      | interrupt is expected. If none is returned, the internal clock may not be working properly.           |
| 0 | 101. | Adapter feedback check  |
| 0 | 110. | Scanner hardware failure  |
| 0 | 111. | Data Set Ready (DSR) dropped during command.  |
| 1 | 000. | Modem error. Comes on with the modem check bit in the secondary control field (SCF) of the            |
|   |      | parameter/status area control block (PSA) and is not used for single current telegraph.               |
| 1 | 001. | Modem transmit clock or Clear to Send (CTS) error. Comes on when in the transmit mode and the         |
|   |      | first character cannot be transmitted. Indicates an external clock error.                             |
| 1 | 010. | DSR-on check. For leased lines, comes on if DSR does not come up within three seconds after           |
|   |      | Data Terminal Ready (DTR).  |
| 1 | 011. | Cable not installed   |
| 1 | 100. | DSR-off check. For switched lines, comes on if DSR does not drop within three seconds of DTR.         |
| 1 | 1010 | CTS failure with test indicate (TI) lead up   |
| 1 | 110. | Auto-call unit (ACU) check. No response was received from an auto-call unit when one was              |
|   |      | expected. If this bit is on, check that the NCP generation parameter that sets the auto-call time-out |
|   |      | contains a greater value than the time-out duration in the ACU.                                       |
| 1 | 1111 | Program failure   |
|   |      |   |

## **Leading Graphics Flag**

....1 Leading graphics received

## **Conditional Extended Responses**

## Extended Response when System Response=X'9F'

X'82' Change Speed command is invalid for the line.

X'83' Specified line is unavailable.

X'84' Error lock

X'85' Usage tier exception. The ACU line is on an LA not allowed by usage tier.

X'E0' Switch Line Mode command was received, but the line was not generated as mode-switchable. Switch Line Mode command was received, but a command is already executing on the line or line X'E1'

trace is active on the line.

# **NCP Channel Commands**

# **Section 4. NCP Channel Commands**

The following table lists NCP commands, command codes, and descriptions.

| Command Code | Command                      | Meaning  |
|--------------|------------------------------|--|
| X'01'        | Write                        | Command transfers data from the host processor main storage to controller storage.   |
| X'02'        | Read                         | Command transfers data from controller storage to the host processor main storage.   |
| X'03'        | No-op                        | This command is required as the last channel command word (CCW) in a Read or Write CCW chain.  |
| X'04'        | Sense                        | Maximum 6 bytes of sense data is transferred to the host.  |
| X'05'        | Write IPL                    | The host initiates this command to replace the controller load module. Normally this command is decoded and handled by the controller hardware and not by NCP. Receipt of this command causes a power-on-reset and initializes the hardware to accept a new control program load. Normally a control program running in the communications controller when the Write IPL is accepted ceases to execute immediately without notification that a Write IPL has occurred. |
| X'09'        | Write Break                  | The Write Break command is identical to the Write command except that it is used to indicate that it is the last or only Write command in a chain of Write CCWs.   |
| X'31'        | Write Start 0                | This is the first command expected in a Write channel program after an IPL of NCP or after a Restart Reset command. It is also expected after each successful Write Start 1 command.   |
| X'32'        | Read Start 0                 | This is the first command expected in a Read channel program after an IPL of NCP or after a Restart Reset command. It is also expected after each successful Read Start 1 command.   |
| X'51'        | Write Start 1                | This is the first command expected in a Write channel program after each successful Write Start 0 command.   |
| X'52'        | Read Start 1                 | This is the first command expected in a Read channel program after each successful Read Start 0 command.   |
| X'61'        | Write XID                    | Command signals to NCP that a channel contact sequence is beginning and to expect the host identification data.  |
| X'62'        | Read XID                     | Command notifies NCP that the host expects to read the NCP identification data.  |
| X'72'        | Read Configura-<br>tion Data | Command requests a predefined number of bytes as indicated in Sense ID data for the controller.  |
| X'93'        | Restart Reset                | Command causes NCP to reset its switches to indicate that the last Write Start and Read Start commands were Write Start 1 and Read Start 1 and that the next expected commands are Write Start 0 and Read Start 0.   |
| X'A3'        | Discontact                   | Command tells NCP to exit the contacted state with the host. The host acts as follows:   |
|              |                              | <ul> <li>Indicates that the channel is no longer contacted</li> <li>Indicates that attachment to the transmission group should be broken</li> <li>Releases PIUs on the channel hold and the intermediate queues.</li> </ul>  |

| Command Code | Command  | Meaning  |
|--------------|----------|--|
| X,C3,        | Contact  | Command tells NCP to set up for operation with the host identification data.           |
| X'E4'        | Sense ID | Contains a maximum of 12 bytes of Sense ID data transfers and RCD command information. |

Note: See the appropriate Communication Controller Principles of Operation for a description of the operation of the test input/output X'00' channel command.

## **Channel Status and Sense Indications**

NCP returns the status to the operating system where the channel places it in the channel status word (CSW). The host program then examines the CSW to determine the status.

The following table is for a device status byte supplied by NCP and 37XX channel adapter hardware.

| Status Bit | Condition            | Testing Priority |
|------------|----------------------|------------------|
| 32         | Attention (See note) | 2                |
| 33         | Status modifier      | 20               |
| 34         | Control unit end     | 18               |
| 35         | Busy                 | 19               |
| 36         | Channel end          | 23               |
| 37         | Device end           | 24               |
| 38         | Unit check           | 5                |
| 39         | Unit exception       | 21               |

Note: If attention occurs with other status, the host program remembers its occurrence but proceeds with the testing of other lower priority bits.

The following table is for the channel status byte supplied by host channel hardware.

| Status Bit | Condition                    | Testing Priority |
|------------|------------------------------|------------------|
| 40         | Program controlled interrupt | 15               |
| 41         | Incorrect length             | 22               |
| 42         | Channel program check        | 16               |
| 43         | Protection check             | 17               |
| 44         | Channel data check           | 4                |
| 45         | Channel control check        | 1                |
| 46         | Interface control check      | 3                |
| 47         | Chaining check               | 14               |

When unit check is present in the CSW, the host program must examine the sense byte (obtained by a Sense command).

| Sense Bit | Condition             | Testing priority |
|-----------|-----------------------|------------------|
| 0         | Command reject        | 12               |
| 1         | Intervention required | 6                |

| Sense Bit | Condition       | Testing priority |
|-----------|-----------------|------------------|
| 2         | Bus out check   | 10               |
| 3         | Equipment check | 9                |
| 4         | Data check      | 11               |
| 5         | Overrun         | 13               |
| 6         | Not initialized | 7                |
| 7         | Abort           | 8                |

Testing priority refers to the priority by which the host operating system tests the indicators in the CSW (and sense byte when UC is on the CSW). Generally, only one of the indicators properly describes the condition of the channel, while other indicators that are set on indicate secondary effects. Use the testing priority to determine the primary condition. Some device or control unit errors can cause more than one sense bit to be present.

## **Channel Program Required for NCP**

The following channel programs are minimum requirements:

| Read Channel Program  |                    |
|---|--------------------|
| CCW X'32' or X'52',*,X'60',1<br>CCW X'02',BUF1,X'60',L'BUF1 | Read Start command |
| -<br>-<br>-   | Read commands      |
| CCW X'02',BUFn,X'60,L'BUFn<br>CCW X'03',*,0,1               | No-op              |

#### Notes:

- 1. The number of Read CCWs must equal the number specified on the MAXBFRU value from an XID for an SNA 4.2 host.
- 2. The byte count in each Read CCW must equal the number specified in the UNITSZ value from an XID for an SNA 4.2 host.

| Write/Write Break Channel Program                           |                                |
|---|--------------------------------|
| CCW X'31' or X'51',*,X'60',1<br>CCW X'01',BUF1,X'60',L'BUF1 | Write Start command            |
| -   | Write and Write Break commands |
| CCW X'09'.BUFn,X'60',L'BUFn<br>CCW X'03',*,0,1              | No-op                          |

#### Write/Write Break and Read Channel Program

```
CCW X'31' or X'51',*,X'60',1
CCW X'01',BUF1,X'60',L'BUF1

- Write and Write Break commands

CCW X'09'.BUFn,X'60',L'BUFn
CCW X'03',*,0,1
CCW X'32' or X'52',*,X'60',1
CCW X'02',BUF1,X'60',L'BUF1

- Read Commands

CCW X'02',BUFn,X'60,L'BUFn
CCW X'02',BUFn,X'60,L'BUFn
CCW X'03',*,0,1
No-op
```

This No-op is not essential for correct operation although it may be desirable for compatibility when the status modifier option is selected. If the status modifier option is not selected, then the Write Break CCW may be command chained to the Read Start CCW. If status modifier is selected, the No-op should be included and not be command chained to the Read Start CCW. If compatibility is desired, include the No-op in the channel program and turn the command chain flag on and off as needed.

## Section 5. NCP Network Commands

The following request/response unit (RU) bytes of a PIU in an SSCP or CDRM session are valid if request/response header (RH) byte 0 contains X'xB' (X'xF' for sense). The x value indicates the following:

- 6 Session control (SC)
- 4 Data flow control (DFC)
- 2 Network control (NC)
- 0 Network services (NS).

## **Summary of NCP Network Commands**

This section contains RU formats only for those SNA commands that NCP processes. The RU formats contain only details that apply to NCP. For other SNA commands and non-NCP details, refer to *SNA Formats*.

#### Notes:

- 1. The RU formats in this section are for an NCP operating in the extended network addressing (ENA) mode.
- 2. An asterisk (\*) indicates a command that NCP does not process.

| RU         | Command    | Function   |
|------------|------------|--|
| 00 (sense) |            | Contains user sense data only  |
| 01 00 01   |            | Change Device Transmission Limit allows a user to change the number of End of Transmission characters (EOTs) that NCP sends to or receives from a device on a BCS/SS multipoint line before servicing other devices on the line. |
| 01 00 02   |            | Change Line Negative Poll Response Limit allows a user to change the number of consecutive negative responses to polling that are acceptable before termination of the Read command.   |
| 01 00 03   |            | Change Line Session Limit allows a user to change the number of BSC/SS sessions that can be active on this BSC/SS line.  |
| 01 02 01   | CONTACT    | Contact starts a contact poll operation to an SDLC station or remote communications controller.  |
| 01 02 02   | DISCONTACT | Discontact causes NCP to stop polling a resource.  |
| 01 02 03   | IPLINIT    | Load Initial initiates the IPL of a remote communications controller.  |
| 01 02 04   | IPLTEXT    | Load Data transfers the text of a load module to a remote communications controller.   |
| 01 02 05   | IPLFINAL   | Load Final informs the remote communications controller that the load process is complete and requests that it provide the NCP entry point to be given control.  |
| 01 02 06   | DUMPINIT   | Dump Initial initiates a remote communications controller storage dump.  |
| 01 02 07   | DUMPTEXT   | Dump Data causes the remote NCP to send a portion of its storage to the SSCP.  |
| 01 02 08   | DUMPFINAL  | Dump Final informs the remote communications controller that the dump procedure is complete.   |

| RU       | Command    | Function  |
|----------|------------|---|
| 01 02 09 | RPO        | Remote Power Off invokes a power-off sequence in a remote communications controller.  |
| 01 02 0A | ACTLINK    | Activate Link activates the data set associated with the SDLC link and, for leased lines, initiates the continuous transmission of flag characters.   |
| 01 02 0B | DACTLINK   | Deactivate Link deactivates the data set associated with the link.  |
| 01 02 0E | CONNOUT    | Connect Out causes NCP to initiate an outbound call on a switched SDLC link. For auto-dial, NCP performs the dial operation with the dial digits provided in the command. For manual dial, NCP enables the link, and the operator performs the dial operation.  |
| 01 02 0F | ABCONN     | Abandon Connection causes the PU to terminate a switched connection.  |
| 01 02 11 | SETCV      | Set Control Vector  |
|          |            | Time and Date (RU byte 5=X'01') allows the SSCP to replace the time and date in NCP. The time is maintained in 24-hour continental time.  |
|          |            | <b>Note:</b> The SSCP is not allowed to retrieve the time and date with a sense state vector request.   |
|          |            | Link Backup (RU byte 5=X'02') associates a link-attached NCP's subarea with a particular SDLC link.   |
|          |            | Physical Unit (RU byte 5=X'03') changes dynamic fields in the common PU block (CUB) that are associated with the specified PU.  |
|          |            | Logical Unit (RU byte 5=X'04') changes dynamic fields in the LU control block (LUB) and completes initialization of the LU vector table (LUV).  |
|          |            | Channel Attention Delay (RU byte 5=X'05') allows the SSCP to change the channel attention delay values in the channel adapter control block (CAB).  |
|          |            | <b>Note:</b> The SSCP is not allowed to change attention delay in a link-attached NCP.  |
|          |            | Gateway Node (RU byte 5=X'15') contains one or more control vectors that cause the gateway NCP to perform one or more of the following actions:   |
|          |            | <ul> <li>Insert the sending SSCP in the gateway SSCP SNP mask</li> <li>Record the real address of an LU or SSCP</li> <li>Obtain a list of virtual routes for session initiation</li> <li>Obtain LU names for substitution in BIND and BIND response.</li> </ul> |
|          |            | Dynamic Path Update (RU byte 5=X'42') allows the SSCP to dynamically update the explicit route and virtual route path data.   |
|          |            | Physical Unit (RU byte 5=X'43') allows the SSCP to update parameters for the SDLC secondary station.  |
| 01 02 14 | ESLOW      | Entering Slowdown informs the SSCP that the normal flow of data in NCP is impeded due to limited available buffers.   |
| 01 02 15 | EXSLOW     | Exiting Slowdown informs the SSCP that the limitation on NCP buffers is lifted. Normal data flow to NCP may resume.   |
| 01 02 16 | ACTCONNIN  | Activate Connect In causes NCP to put the specified link in answer mode. This enables the link to answer incoming calls.  |
| 01 02 17 | DACTCONNIN | Deactivate Connect In causes NCP to discontinue answer mode on the specified link.  |
| 01 02 18 | ABCONNOUT  | Abandon Connect Out causes NCP to halt the dialing operation over the specified link.   |
| 01 02 19 | ANA        | Assign Network Addresses assigns a set of network addresses to a specified PU (SDLC switched link only).  |

| RU       | Command     | Function   |
|----------|-------------|--|
| 01 02 1A | FNA         | Free Network Addresses causes NCP to free the network addresses that were assigned to a PU.  |
| 01 02 1B | REQDISCONT* | Request Discontact requests that NCP issue a Discontact.   |
| 01 02 80 | CONTACTED   | Contacted informs the SSCP of conditions presently existing in the resource.   |
| 01 02 81 | INOP        | Inoperative reports a loss of contact to the SSCP.   |
| 01 02 84 | REQCONT     | Request Contact informs the SSCP that a physical connection has been established between NCP and a PU (contains the station ID).   |
| 01 02 85 | LSA-NS      | Lost Subarea informs the SSCP that subareas have been lost.  |
| 01 03 01 | EXECTEST    | Execute Test causes NCP to execute an Online Terminal Test (OLTT) for the resource specified by the network address.   |
| 01 03 02 | ACTTRACE    | Activate Trace is used by the host to initiate the following traces:   |
|          |             | <ul> <li>Line trace</li> <li>Scanner interface trace (SIT)</li> <li>Internal PIU trace (includes a transmission group trace)</li> <li>Generalized PIU trace.</li> </ul>    |
| 01 03 03 | DACTTRACE   | Deactivate Trace is used by the host to terminate the following traces:  |
|          |             | <ul> <li>Line trace</li> <li>SIT</li> <li>Internal PIU trace (includes a transmission group trace)</li> <li>Generalized PIU trace.</li> </ul>                              |
| 01 03 11 | SETCV       | Set Control Vector   |
|          |             | Intensive Mode (RU byte 5=X'08') allows the SSCP to activate or deactivate intensive mode.   |
| 01 03 31 | DISPSTOR    | Display Storage requests NCP physical services to return up to 256 bytes of NCP, MOSS, or communication scanner processor (CSP) storage beginning at a specified location. |
| 01 03 34 | RECSTOR     | Record Storage is sent to the SSCP with data previously requested by a successful display storage command.   |
| 01 03 81 | RECMS       | Record Maintenance Statistics. See Section 14, "Record Maintenance Statistic (RECMS) Request/Response Unit (RU) Formats."  |
| 01 03 82 | RECTD       | Record Test Data informs the SSCP of the current status of an OLTT.  |
| 01 03 83 | RECTRD      | Record Trace Data sends line trace information to the SSCP.  |
| 01 06 04 | NSPE*       | NS Procedure Error informs the issuer of a nonsequenced request that an error occurred after the request was accepted but before the procedure was completed.              |
| 01 06 81 | INIT-SELF*  | Initiate-Self allows an LU to request a session with the SSCP.   |
| 01 06 83 | TERM-SELF*  | Terminate-Self allows an LU to request the termination of a session with the SSCP.   |
| 02 (NC)  | IPL-FINAL   | IPL Final  |
| 03 (NC)  | IPL-INIT    | IPL Initial  |
| 04 (NC)  | IPL-TEXT    | IPL Text   |
| 05 (DFC) | LUSTAT*     | Logical Unit Status sends status information from an LU to its session partner.  |
| 05 (DFC) | RTR*        | Ready to Receive is used in bracket protocol to indicate that the bidder is now allowed to initiate a bracket.   |

| RU               | Command       | Function   |  |
|------------------|---------------|--|--|
| 05 (NC)          | LSA           | Lost Subarea informs the adjacent NCP or SSCP that subareas have been lost.  |  |
| 06 (NC)          | ER.INOP       | Explicit Route Inoperative informs NCP that an explicit route is inoperative.  |  |
| 07               | ANSC          | Auto Network Shutdown Complete informs the SSCP that NCP auto network shutdown is complete.  |  |
| 08 (sense)       |               | Request Rejected   |  |
| 09 (NC)          | ER.TEST       | Explicit Route Test determines the network address of the last usable node in an explicit route, or verifies that an explicit route is usable for data transfer.   |  |
| 0A (NC)          | ER.TEST.REPLY | Explicit Route Test Reply carries results of an ER.TEST command back to the ER.TEST command originator.  |  |
| 0B (NC)          | ER.ACT        | Activate Explicit Route activates an explicit route.   |  |
| OC (NC)          | ER.ACT.REPLY  | Activate Explicit Route Reply carries results of an ER.ACT command back to the ER.ACT command originator.  |  |
| 0D (NC)          | ACTVR         | Activate Virtual Route activates a virtual route.  |  |
| 0D (SC)          | ACTLU         | Activate Logical Unit establishes a session between the SSCP and an LU.  |  |
| 0E (NC)          | DACTVR        | Deactivate Virtual Route terminates a virtual route.   |  |
| 0E (SC)          | DACTLU        | Deactivate Logical terminates the session between the SSCP and an LU.  |  |
| 0F (NC)          | ER.OP         | Explicit Route Operative informs NCP that the explicit route is operative.   |  |
| 10 (sense)       |               | Request Error  |  |
| 11               | ACTPU         | Activate Physical Unit establishes a session between the SSCP-NCP PU physical services or SSCP-PU physical services.   |  |
| 12               | DACTPU        | Deactivate Physical terminates the session between the SSCP-NCP PU physical services or SSCP-PU physical services.   |  |
| 14               | ACTCDRM       | Activate CDRM activates a CDRM session.  |  |
| 15               | DACTCDRM      | Deactivate CDRM deactivates a CDRM session.  |  |
| 20 (sense)       | State Error   |  |  |
| 31               | BIND          | Bind Session establishes a session between a host application program and an LU.   |  |
| 32               | UNBIND        | UNBIND Session terminates the session between the host application program and an LU.  |  |
| 33               | SWITCH        | A primary LU (PLU) sends Switch Data Traffic to a secondary LU (SLU) to change the extended recovery facility (XRF) state of the LU-LU session from XRF-primary to XRF-backup or from XRF-backup to XRF-primary. |  |
| 40 (sense)       |               | RH Usage Error   |  |
| 41 02 10         | RNAA          | Request Network Address Assignment requests NCP to allocate the specified number of network addresses to the specified network resource and to update path control routing.                                      |  |
| 41 02 20         | NOTIFY        | Flowing from the SSCP to NCP, this command causes NCP to abort preparations for a specified session.   |  |
|                  |               | Flowing from NCP to the SSCP, it informs the SSCP that a session was terminated or could not be initiated.   |  |
| 41 02 87<br>(NC) | LCP           | Lost Control Point informs each SSCP in session with NCP PU services of a lost SSCP.   |  |

| RU         | Command    | Function  |  |
|------------|------------|---|--|
| 41 02 89   | ROUTE.INOP | Route Inoperative informs SSCPs when a virtual route or explicit route has become inoperative.  |  |
| 41 02 8A   | REQACTCDRM | REQACTCDRM prompts the receiving SSCP to issue RNAA and SETCV to set up a cross-network address transform.  |  |
| 41 03 04   | REQMS      | Request Maintenance Statistics is used by the host to solicit link problem determination aid (LPDA) status, summary error data, and engineering chang (EC) level data. It is also used by the host to enable session trace, inhibit session trace, or request trace data. |  |
| 41 03 05   | ТМ         | Test Mode causes NCP to execute an SDLC link test level 2 (LL2) for the dedicated resource specified by the network address or to stop an active link test.   |  |
| 41 03 07   | ROUTE.TEST | Route Test causes NCP to report the status of specified routes and optionally to send NC.ER.TEST on these routes.   |  |
| 41 03 84   | RECFMS     | Record Formatted Maintenance Statistics. See Section 15, "Record Formatted Maintenance Statistic (RECFMS) Request/Response Unit (RU) Formats."  |  |
| 41 03 85   | RECTR      | Record Test Results sends the test results of the SDLC LL2 to the SSCP.   |  |
| 41 03 86   | ER.TESTED  | Explicit Route Tested is a copy of the explicit route test reply request, and it notifies the owning SSCP of the results of an explicit route test.   |  |
| 41 03 8D   | NMVT       | Network Management Vector Transport. See Section 16, "Network Management Vector Transport (NMVT) Request/Response Unit (RU) Formats."   |  |
| 51         |            | Switch Line to NCP Mode (BSC/SS) switches the line from EP to NCP mode.   |  |
| 52         |            | Switch Line to EP Mode (BSC/SS) switches the line from NCP to EP mode.  |  |
| 80 (sense) |            | Path Error  |  |
| 80         | QEC*       | Quiesce at End of Chain directs a function manager to enter the quiesce state at the end of the chain it is currently sending.  |  |
| 81 (DFC)   | QC*        | Quiesce Complete indicates that the issuer of the request has placed itself in the quiesce state.   |  |
| 81 06 01   | CINIT*     | Control Initiate  |  |
| 81 06 02   | CTERM*     | Control Terminate   |  |
| 81 06 20   | NOTIFY     | Notify sends information from an LU to the SSCP, or from the SSCP to an LU.   |  |
| 81 06 80   | INIT-OTHER | Initiate-Other  |  |
| 81 06 81   | INIT-SELF* | Initiate-Self   |  |
| 81 06 82   | TERM-OTHER | Terminate-Other   |  |
| 81 06 83   | TERM-SELF* | Terminate-Self  |  |
| 81 06 85   | BINDF*     | Bind Failure  |  |
| 81 06 86   | SESSST*    | Session Started   |  |
| 81 06 87   | UNBINDF*   | UNBIND Failure  |  |
| 81 06 88   | SESSEND    | Session Ended   |  |
| 81 26 01   | BFCINIT    | Boundary Function (BF) Control Initiate. The SSCP requests BF (PLU) to attempt to activate (through a BIND) a session with the specified SLU.   |  |
| 81 26 29   | BFCLEANUP  | The SSCP sends a Boundary Function Clean Up PIU to terminate a specific LU-LU session.  |  |

| RU       | Command    | Function  |  |
|----------|------------|---|--|
| 81 26 81 | BFINIT     | BF (PLU) sends BF Initiate to the SSCP to request initiation of a session between two LUs named in the BIND image.  |  |
| 81 26 83 | BFTERM     | BF (PLU) sends a BF Terminate PIU to the SSCP to request assistance in the termination of the identified LU-LU session.   |  |
| 81 26 86 | BFSESSST   | BF (PLU) sends a BF Session Started PIU to inform the SSCP that a new session has been activated and to provide information about the active session.                               |  |
| 81 26 88 | BFSESSEND  | BF (PLU) sends a BF Session Ended PIU to notify the SSCP that the LU-LU session identified has been deactivated.  |  |
| 81 26 8C | BFSESSINFO | The BF Session Information PIU provides the SSCP with information about sessions with independent LUs in a peripheral node when taken over by a receiving SSCP.                     |  |
| 81 86 20 | NOTIFY*    | Notify sends information from an SSCP to an SSCP.   |  |
| 81 86 41 | CDINIT*    | Cross-Domain Initiate   |  |
| 81 86 43 | CDTERM*    | Cross-Domain Terminate  |  |
| 81 86 45 | CDSESSSF*  | Cross-Domain Setup Failure  |  |
| 81 86 46 | CDSESSST*  | Cross-Domain Session Started  |  |
| 81 86 47 | CDSESSTF*  | Cross-Domain Session Takedown Failure   |  |
| 81 86 48 | CDSESSEND* | Cross-Domain Session Ended  |  |
| 81 86 49 | CDTAKED*   | Cross-Domain Takedown   |  |
| 81 86 4A | CDTAKEDC*  | Cross-Domain Takedown Complete  |  |
| 81 86 4B | CDCINIT*   | Cross-Domain Control Initiate   |  |
| 82       | RELQ*      | Release Quiesce releases a function manager from the quiesce state.   |  |
| 83       | CANCEL*    | Cancel terminates a partially sent chain of function manager (FM) data requests.  |  |
| 84       | CHASE*     | Chase requests the receiving function manager to return all outstanding data responses and data flow control responses.   |  |
| A0       | SDT        | Start Data Traffic enables data flow in a session. It is the final request in a data flow initialization or recovery procedure.   |  |
| A1       | CLEAR      | Clear removes and discards all PIUs with the same OAF/DAF pair from the destination process queue.  |  |
| A2       | STSN*      | Set and Test Sequence Numbers resynchronizes the specified sequence number.   |  |
| A3       | RQR*       | Request Recovery initiates data traffic recovery procedures.  |  |
| CO       | SHUTD*     | Shutdown requests the secondary function manager to enter the highest level of quiesce.   |  |
| C1       | SHUTC*     | Shutdown Complete indicates that the sender has shut down.  |  |
| C2       | RSHUTD*    | Request Shutdown informs the primary function manager that the secondary function manager is at "end of job" and requests the primary function manager to issue a shutdown request. |  |
| C8       | BID*       | Bid is used in bracket protocol to request permission to begin a bracket.   |  |
| C9       | SIG*       | Signal sends an expedited signal through the network against the normal flow of data.   |  |

## **Bring-Up Command Sequence**

The following command sequence is followed for bring-up and session initiation for switched SDLC on a channel-attached NCP peripheral link. The nonswitched SDLC sequence is provided by skipping those entries identified as being required for switched SDLC.

| Command                                       | Description  |
|---|--|
| WXID 1  | Host alerts NCP beginning channel contact.   |
| Write Break <sup>1</sup>                      | Host sends the host exchange identification (XID) to NCP.                            |
| RXID <sup>1</sup>                             | Host expects to receive the NCP XID.   |
| Read <sup>1</sup>                             | Host reads the NCP XID.  |
| Contact 1                                     | From host to put NCP in a contacted state (activates the channel transmission group) |
|   | Explicit route status is exchanged through Explicit Route Operative (ER OP) PIUs.    |
| Activate Explicit Route                       | From SSCP to NCP   |
| Activate Explicit Route<br>Reply              | From NCP to SSCP   |
| Activate Virtual Route                        | From SSCP to NCP   |
|   | Virtual route pacing responses are exchanged.  |
| Activate Physical Unit                        | From SSCP to NCP physical services   |
| Start Data Traffic                            | From SSCP to NCP physical services   |
| Set Control Vector                            | From SSCP to NCP physical services   |
| Activate Link                                 | From SSCP to NCP physical services   |
| Contact Out or Activate Connect In (Switched) | SSCP to NCP physical services connection point manager-outbound (CPM-OUT)            |
| Request Contact (Switched)                    | NCP physical services to SSCP  |
| Set Control Vector PU (Switched)              | SSCP to NCP physical services  |
| Contact                                       | From SSCP to NCP physical services   |
| Contacted                                     | From NCP physical services to SSCP   |
| Activate Physical Unit                        | SSCP to the NCP PU process queue   |

<sup>1</sup> Host channel commands. The host channel Read and Write commands for the other PIUs are not shown.

| Command                                 | Description                        |
|---|------------------------------------|
| Assign Network<br>Addresses (Switched)  | SSCP to NCP physical services      |
| Set Control Vector LU (Switched)        | SSCP to NCP physical services      |
| Activate Logical Unit                   | SSCP to the LU/SSCP process queue  |
| Initiate-Self (LU-initiated logon only) | From LU to SSCP                    |
| Bind                                    | Host application to LU             |
| Start Data Traffic                      | From host application to LU        |
| Inoperative <sup>2</sup>                | From NCP physical services to SSCP |

<sup>&</sup>lt;sup>2</sup> May be required at any point in the command sequences after the Activate Link command.

The following command sequence brings up a cross-domain subarea link.

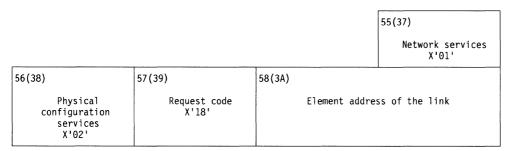

| Command                          | Description  |
|----------------------------------|--|
| WXID 1                           | Host alerts NCP beginning channel contact.   |
| Write Break <sup>1</sup>         | Host sends the host XID to NCP   |
| RXID <sup>1</sup>                | Host expects to receive the NCP XID.   |
| Read <sup>1</sup>                | Host reads the NCP XID   |
| Contact <sup>1</sup>             | From host to put NCP in a contacted state (activates the channel transmission group)   |
|                                  | Explicit route status is exchanged through Explicit Route Operative (ER OP) PIUs.  |
| Activate Explicit Route          | From SSCP to the channel-attached NCP  |
| Activate Explicit Route<br>Reply | From the channel-attached NCP to SSCP  |
| Activate Virtual Route           | From SSCP to the channel-attached NCP  |
|                                  | Virtual route pacing responses are exchanged.  |
| Activate Physical Unit           | SSCP to the channel-attached NCP's physical services   |
| Start Data Traffic               | SSCP to the channel-attached NCP's physical services   |
| Activate Link                    | SSCP to the channel-attached NCP's physical services   |
| Contact                          | SSCP to channel-attached NCPs (activates the link transmission group)  |
| Contacted                        | Channel-attached NCP to SSCP   |
|                                  | Explicit route status is exchanged through Explicit Route Operative (ER OP) PIUs.  |
| Activate Explicit Route          | SSCP to the link-attached NCP  |
| Activate Explicit Route<br>Reply | Link-attached NCP to SSCP  |
| Activate Virtual Route           | SSCP to the link-attached NCP  |
|                                  | Virtual route pacing responses are exchanged.  |
| Activate Physical Unit           | SSCP to the link-attached NCP's physical services  |

### **Contacted RU**

#### Request Format

**Note:** Bytes 55(37) through 60(3C) are included in all Contacted types.

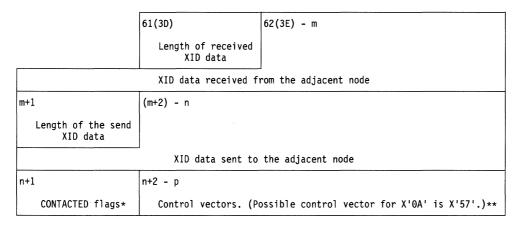

**Note:** If the load status at location 60(3C) is X'01', X'02', or X'03', the Contacted RU ends here. Also indicates a byte expansion follows.

If the load status at location 60(3C) is X'04' or X'09', the following parameters are included.

<sup>\*\*</sup> See "Control Vectors and Control Lists" on page 5-138.

If the load status at location 60(3C) is X'05', X'07', X'08', X'0A' (with XIDs appended), or X'0B', the following parameters are included.

<sup>\*</sup> Indicates a byte expansion follows.

If the load status at location 60(3C) is X'0A' (without XIDs appended), the following Contacted RU format is sent to the the SSCP.

|   | 61(3D)                                      | 62(3E)                                  | 63(3F)           |
|---|---|---|------------------|
|   | Length of the<br>received XID data<br>X'00' | Length of the sent<br>XID data<br>X'00' | CONTACTED flags* |
| 64(40) - n  |   | •                                       |                  |
| Control vectors. (Possible control vector is X'57')** |   |   |                  |

<sup>\*</sup> Indicates a byte expansion follows.

<sup>\*\*</sup> See "Control Vectors and Control Lists" on page 5-138.

<sup>\*\*</sup> See "Control Vectors and Control Lists" on page 5-138.

| Offset/Field<br>Name  | Bit Pattern/<br>Hex Value | Contents   |

|                      | 0000 1000                 | Scanner interface trace (SIT) alone*       |
|                      | 0000 1001                 | LT or transmission group, and SIT          |
|                      | 0100 0000                 | Generalized PIU trace (GPT)—never combined |

**Note:** For lines attached to an NCP/token-ring interconnection (NTRI), note the following:

- When LT is specified, NCP deactivates both the LT and the IOH trace.
- When SIT is specified, NCP deactivates the token-ring interconnection coupler (TIC) internal trace being run in place of the SIT.

| 61(3D) |       | Option (type=GPT only)   |  |
|--------|-------|--|--|
|        | X'01' | Specific hierarchy. Bytes 7 and 8 contain the hierarchy address. |  |
|        | X'00' | All eligible resources   |  |

|              | X'13'     | XRF primary hierarchical reset                             |
|              | X'FE'     | Session failure-reason in associated sense code            |

### **Control Vectors and Control Lists**

The following table shows, by key value, the requests and responses that carry the specific control vector. Formats for the control vector keys follow this table.

| Control Vector<br>Key | Requests or Responses Carrying the Vector                           |
|-----------------------|---|
| X'00'                 | Used in RSP (ACTLU)   |
| X'01'                 | Used in SETCV   |
| X'02'                 | Used in SETCV   |
| X'03'                 | Used in SETCV   |
| X'04'                 | Used in SETCV   |
| X'05'                 | Used in SETCV   |
| X'06'                 | Used in ACTCDRM, RSP (ACTCDRM)                                      |
| X'08'                 | Used in SETCV   |
| X'09'                 | Used in ACTCDRM, ACTPU, RSP (ACTCDRM) (ACTPU)                       |
| X'0A'                 | Used in BFCINIT, BFCLEANUP, BFINIT, and BFTERM                      |
| X'0B'                 | Used in ACTPU, RSP (ACTPU)  |
| X,0C,                 | Used in RSP (ACTLU)   |
| X'0D'                 | Used in BFCINIT   |
| X'0E'                 | Used in ACTPU, RSP (ACTPU), BFCINIT, BIND, XID, and CONTACT (ACTLU) |
| X'0F'                 | Used in RSP (ACTLINK)   |
| X'11'                 | Used in RSP(ACTPU)  |
| X'12'                 | Used in CONNOUT, NOTIFY, XID  |
| X'13'                 | Used in ACTCDRM, RSP (ACTCDRM)                                      |
| X'15'                 | Used in BFCINIT, NOTIFY, and SETCV                                  |
| X'16'                 | Used in BFCINIT and SETCV   |
| X'18'                 | Used in ACTCDRM, ACTPU, RSP (ACTCDRM)                               |
| X'1A'                 | Used in SETCV   |
| X'1B'                 | Used in NOTIFY and SETCV  |
| X'1E'                 | Used in BFSESSST, NOTIFY, and SESSST                                |
| X'1F'                 | Used in NC.ER.TEST.REPLY and ER.TESTED                              |
| X'20'                 | Used in RSP (ROUTE.TEST)  |
| X'22'                 | Used in XID   |
| X'23'                 | Used in BFINIT, BFSESSST, and SESSST                                |
| X'27'                 | Used in BIND  |
| X'28'                 | Used in SESSST and RSP (ACTLU)                                      |
| X'29',                | Used in NOTIFY and RSP (SWITCH)                                     |
| X'2A'                 | Used in RSP (ACTLU) and BFSESSINFO                                  |
| X'2B'                 | Used in BFSESSST and BIND   |
| X'2C'                 | Used in BFCINIT and BIND  |

| Control Vector<br>Key | Requests or Responses Carrying the Vector  |  |
|-----------------------|--|--|
| X'2D'                 | Used in BFCINIT and BIND   |  |
| X'31'                 | Used in BFSESSST   |  |
| X'35'                 | Used in BFCLEANUP, BFSESSEND, BFTERM, SESSEND, and UNBIND                                  |  |
| X'3A'                 | Used in RSP (ROUTE.TEST)   |  |
| X'3B'                 | Used in RSP (ROUTE.TEST)   |  |
| X'42'                 | Used in SETCV  |  |
| X'43'                 | Used in RNAA and SETCV   |  |
| X'46'                 | Used in ACTCONNIN, BFSESSST, BIND (within CV X'2B'), CONNOUT, and CONTACT                  |  |
| X'52'                 | Used in BFCINIT  |  |
| X'56'                 | Used in SETCV, REQCONT, and in XID2s   |  |
| X'57'                 | Used in CONTACTED, and REQCONT   |  |
| X'60'                 | Used in BFCINIT, BFSESSEND, BFSESSST, BFTERM, BIND, RSP (BIND), SESSEND, SETCV, and UNBIND |  |
| X'68'                 | Used in RSP(ACTLU), BIND, and SESST  |  |
| X'69'                 | Used in CONNOUT  |  |
| X'6A'                 | Used in RSP(ROUTE.TEST)  |  |
| X'80'                 | Used in REQCONT and SETCV  |  |
| X'81'                 | Used in SETCV  |  |
| X'FE'                 | Used in RSP (ACTPU), (ACTCDRM). Also used in negative RSP (ACTLU).                         |  |

Control vector formats are displayed with zero-indexing of the vector bytes. See the individual RU description for the actual displacement within the RU.

### **Control Vector Formats**

# **SSCP-LU Session Capabilities Control Vector**

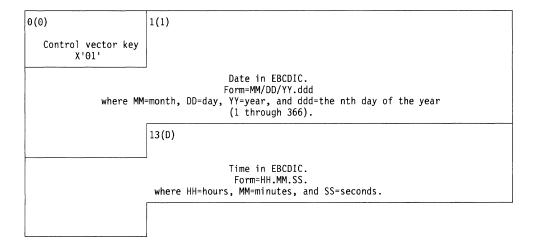

| 0(0)                        | 1(1)            | 2(2)             |
|-----------------------------|-----------------|------------------|
| Control vector key<br>X'00' | Maximum RU size | LU capabilities* |
| 4(4)                        |                 |                  |
| Reserved                    |                 |                  |

|-----------------------------|---|
| Control vector key<br>X'05' | New attention delay value in tenths of a second |

## **CDRM Control Vector**

| 0(0)                        | 1(1)                                  | 2(2)                    | 3(3) - 4(4) |  |  |
|-----------------------------|---------------------------------------|-------------------------|-------------|--|--|
| Control vector key<br>X'06' | Vector data field<br>length in binary | ACTDRM profile<br>X'00' |             |  |  |
|                             | ACTCDRM usage*                        |                         |             |  |  |
|                             |                                       |                         |             |  |  |
|                             |                                       |                         |             |  |  |

<sup>\*</sup> Indicates a byte expansion follows.

#### **Byte Expansions**

| Offset/Field |             |  |
|--------------|-------------|--|
| Name         | Bit Pattern | Contents   |
| 3(3)         |             | ACTCDRM usage  |
|              | Byte 0      | •  |
|              | 1           | Name pair session key (X'06') is not supported.  |
|              | .1          | Address pair session key (X'07') is supported. (See note.)   |
|              | 1           | Parallel sessions are supported.   |
|              | 1           | A user request correlation (URC) is supported by SSCP.   |
|              | 1           | CDINIT (TYPE = DQ) (format 1 or 4) with type field bits specifying "leave on queue if dequeue retry is unsuccessful" is supported. |
|              | 1           | Procedure correlation ID (PCID) session key is supported.  |
|              | 1.          | CDSESSEND from SSCP (secondary LU) and CDINIT (format 2) are supported.  |
|              | x           | Reserved   |

Note: If the control vector is omitted or the length is 0, the corresponding request or response implicitly specifies that the name pair session key (X'06') is supported and the others are not.

|        | ACTCDRM usage (continued)  |
|--------|--|
| Byte 1 |  |
| 1      | SSCP supports the primary LU capability indicator in LU Status Control List (X'01'). |
| .1     | Network-qualified address pair session key is supported.                             |
| 1      | INIT.OTHER.CD format 2 is supported.   |
| 1      | INIT.OTHER.CD format 3 is supported.   |
| 1      | Format 3 and 4 CDINIT are supported. Includes network addressable unit               |
| *      | (NAU) address control vector (X'1A'). (See note.)                                    |
| 1      | Format 1 CDCINIT is supported.   |
| 1.     | NOTIFY key X'06' is supported.   |
| 1      | Notification of lost session (LU-LU) awareness is supported.                         |
|        | 1<br>.1<br>.1<br>1<br>1  |

Note: If control vector X'13' is also included in this ACTCDRM request or response, CDINIT format 3 or 4 may include additional control vectors for cross-network session setup.

#### Intensive Mode Control Vector

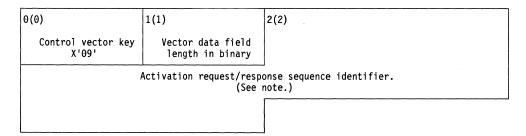

| 0(0)                                  | 1(1)                     | 2(2)  |
|---------------------------------------|--------------------------|---|
| RU1SCV<br>Control vector key<br>X'08' | RU1SACT*<br>SETCV action | RU1SIMC<br>Maximum number of intensive mode records |

<sup>\*</sup> Indicates a byte expansion follows.

#### **Byte Expansion**

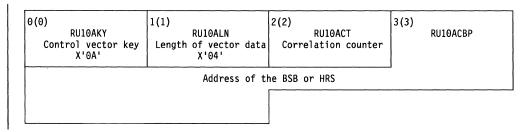

| Offset/Field<br>Name | Hex Value | Contents                   |
|----------------------|-----------|----------------------------|
| 1(1)                 |           | SETCV action               |
| RU1SACT              | X'00'     | Deactivate intensive mode. |
|                      | X'80'     | Activate intensive mode.   |

### **Activation Request/Response Sequence Identifier Control Vector**

Note: The activation request/response sequence identifier is an 8-byte binary value, generated by the sender of ACTCDRM, RSP (ACTCDRM), ACTPU, and echoed in RSP (ACTPU), and used by the receiver to determine whether the current RU supercedes a previously received RU from the same sender. If the current RU has an activation request/response sequence identifier value greater than the corresponding activation request/response sequence identifier value of the earlier ACTPU, ACTCDRM, or RSP (ACTCDRM), the current RU is accepted and processed while the earlier RU is superseded. The 8-byte field has the following characteristics: If n2 was generated at time t2, n3 was generated at time t3, and t2 is less than t3, then n2 is less than n3.

## **User Request Correlation (URC) Control Vector**

## **SSCP-PU Session Capabilities Control Vector**

Note: This control vector is sent on ACTPU and RSP(ACTPU) for PU\_T4|5. It defines the capabilities of the SSCP or PU\_T4|5 building the request or response. The network addressable unit (NAU) reports all of its capabilities; if an NAU does not report support for a particular function, its session partner is responsible for not invoking that function. The receiving NAU ignores bits that it does not understand.

|                      | 1                         | NCP and MOSS support multiple load modules  |
|                      | .1                        | Extended control vector X'43' support   |
|                      | 1                         | Move PU is supported  |
|                      | x x                       | Reserved  |
|                      | 1                         | Non-native network attachment is supported  |
|                      | 1.                        | Non-disruptive takeover of sessions on switched links is supported  |
|                      | 1                         | Dynamic path update is supported  |

#### Notes:

- 1. An SSCP always receives ER.TESTED for routes in its own subnetwork. This bit also indicates whether ROUTE.INOP may flow for lost explicit routes or virtual routes in this SSCP subnetwork.
- 2. The sending SSCP supports receipt of BFINIT, BFTERM, BFSESSINFO, RSP (ACTLU) with the Session Information control vector, BFSESSST, BFSESSEND, CONTACTED X'0A', and CONTACTED X'0B'; and the sending PU\_T4|5 supports receipt of extended BINDs, stand-alone BINDs from T2.1 nodes, non-activation CONTACT, RNAA assignment types 4 and 5, control vector X'43', and BFCLEANUP from its SSCP.

### **Load Module Correlation Control Vector**

### **Network ID Control Vector**

# **Gateway Support Capabilities Control Vector**

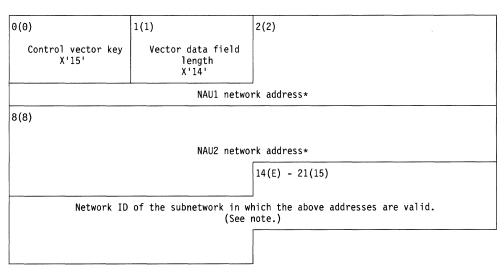

| 0 | 9(0)               | 1(1)              | 2(2)          |
|---|--------------------|-------------------|---------------|
|   | Control vector key | Vector data field | Session keys. |
|   | X'13'              | length in binary  | (See note.)   |

**Note:** The session keys appear in the following order:

X'15' network-qualified address pair (NAU1 and NAU2) define the sender's address and the destination address, respectively, as known of the sender.

X'15' network-qualified address pair (NAU1 and NAU2) define the origin address and the destination address, respectively, as known in the network adjacent to the sender.

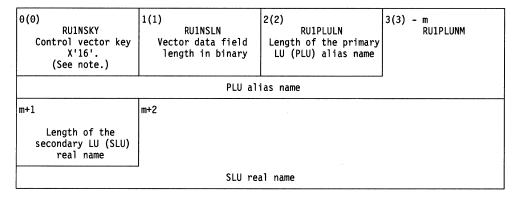

### **Network-Qualified Address Pair Control Vector**

<sup>\*</sup> See the SNA Reference Summary for the particular RUs that carry this control vector.

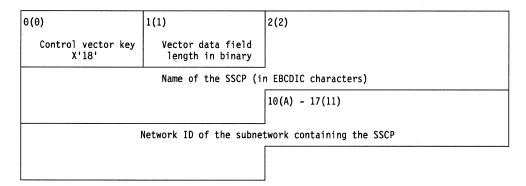

**Note:** The length byte is set to 12 when the network ID is not included and to 20 when the network ID is included. If the network ID contains all space (X'40....40') characters, the network addresses are in the sender's network.

### **Names Substitution Control Vector**

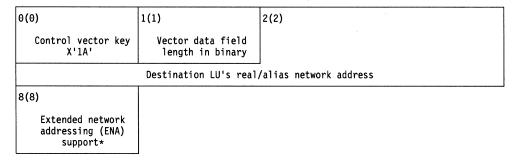

Note: The network-qualified address pair control vector always accompanies this vector in SETCV.

### **SSCP Name Control Vector**

## **Network Addressable Unit (NAU) Address Control Vector**

<sup>\*</sup> Indicates a byte expansion follows.

### **QUERY Command Control Vector**

Note: The QUERY command control vector is a context-sensitive control vector that is architected to flow only on SETCVs and SETCV-REPLYs

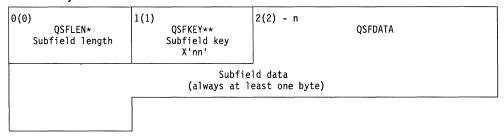

- Indicates a byte expansion follows.
- The control vector length does not include the three byte control vector header (i.e., the control vector key and length fields).
- \*\*\* In a Query SETCV request, these subfields correspond in sequence to the subfield\_id, subfield\_string pairs coded on the VTAM MODIFY QUERY command. In a Query SETCV-REPLY, these subfields are in response to the subfield\_id, subfield\_string pairs coded on the VTAM MODIFY QUERY command.

### **Byte Expansions**

| Offset/Field<br>Name | Bit Pattern/<br>Hex Value | Contents   |
|----------------------|---------------------------|--|
| 2(2)<br>QS81FLGS     |                           | Flags byte   |
|                      | 1                         | Program operation application (POA) no longer active (QS81POD) |
|                      | .xxx xxxx                 | Reserved   |

### Generic layout of a subfield:

- \* Includes the length and key fields.
- \*\* Where X'nn' is between X'80' to X'FD'.

### **Control Vector Keys Not Recognized Control Vector**

| 0(0)   | 1(1)                                  | 2(2) - n   |
|--|---------------------------------------|--|
| Control vector key.<br>X'FE'.<br>(See note.) | Vector data field<br>length in binary | One or more 1-byte control vector key values<br>that were not recognized in the<br>corresponding request |

Note: The control vector X'FE' is used to report the receipt of one or more unrecognized control vectors, provided that each unrecognized control vector has a length field. Control vectors X'00' through X'05', X'07', and X'08' have no length fields; all others do. A negative response of X'0835'=invalid parameter (with pointer only) is returned if a request is received with an unrecognized control vector with a key less than or equal to X'08'. When all unrecognized control vectors have keys greater than X'08', the receiver responds using a X'FE' control vector that identifies each unrecognized control vector by key. This allows the response sender to indicate that some control vectors have been processed, while others have not.

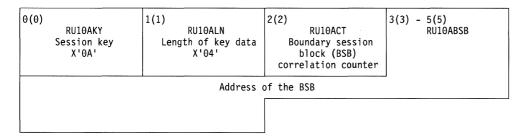

# **Session Keys**

The following table shows, by session key value, the requests that carry the specific session key. Formats for the session keys follow this table.

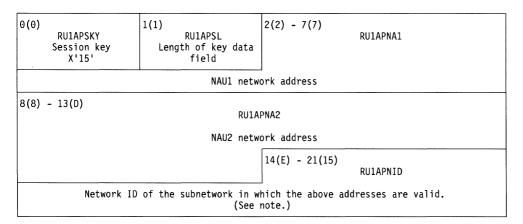

| Session Key | Requests Carrying the Session Key   |
|-------------|---|
| X'0A'       | Used in BFCINIT, BFCLEANUP, BFINIT, and BFTERM  |
| X'15'       | Used in BFCLEANUP, BFSESSEND, BFSESSST, BFTERM, Notify (LU-SSCP), SESSST, and SESSEND |

Session key formats are displayed with zero-indexing of the key bytes. See the individual RU description for the actual displacement within the RU.

# **User Request Correlation (URC) Session Key**

# **Network-Qualified Address Pair Session Key**

Note: The length byte is set to 12 when the network ID is not included and to 20 when the network ID is included. If the network ID is not present, the network addresses are in the sender's network.

# **Isolated Pacing Message (IPM) Formats**

### **IPM**

| S2(34) RH1B0** Request/response header (RH) byte 0 X'83' | 53(35)<br>RH1B1**<br>RH byte 1<br>X'01' | 54(36)<br>RH1B2**<br>RH byte 2<br>X'00' | 55(37)<br>IMP10PTN*<br>IPM options |

# Section 6. SDLC Commands and Responses

Following is a list of SDLC commands, with each command's control field and function.

# 1-Byte Control Field (Modulo 8)

**Unnumbered Format: (Bits 6,7=11)** 

### Requests

| Command<br>Requests                             | Control<br>Field<br>(Binary) | Control<br>Field<br>(Hex) | Function   |
|---|------------------------------|---------------------------|--|
| Set Initialization Mode (SIM)                   | 0001 0111                    | 17                        | Command initiates system-specified procedures at the receiving secondary station for the purpose of initializing link-level functions. |
| Unnumbered Poll (UNP)                           | 0011 0011                    | 33                        | Command is used with a group address to perform a poll of a group of secondary stations.   |
| Disconnect (DISC)                               | 0101 0011                    | 53                        | Command terminates other modes and places the receiving secondary station effectively offline.   |
| Set Normal Response<br>Mode (SNRM)              | 1001 0011                    | 93                        | Command subordinates the receiving secondary station to the transmitting primary station (modulo 8).                                   |
| LPDA Test                                       | 0001 1011                    | 1B                        | Link problem determination aid (LPDA) test command   |
| Exchange Identification (XID)                   | 1011 1111                    | BF                        | Command is used by NCP to solicit the station identification from a secondary station.   |
| Set Normal Response<br>Mode Extended<br>(SNRME) | 1101 1111                    | DF                        | Command subordinates the receiving secondary station to the transmitting primary station (modulo 128).                                 |
| Test  | 1111 0011                    | F3                        | SDLC test command  |

# Responses

| Command<br>Requests                  | Binary    | Hex | Function  |
|--------------------------------------|-----------|-----|---|
| Request Initialization Mode (RIM)    | 0001 0111 | 17  | Command notifies the primary station that the secondary station has a need for an SIM command.  |
| Disconnect Mode (DM)                 | 0001 1111 | 1F  | Command indicates that the transmitting secondary station is disconnected or that the reset configurable station has received an XID. |
| Unnumbered Poll<br>Response (UNP)    | 0011 0011 | 33  | Command is a response to an unnumbered poll indicating no data queued for transmission for the group.                                 |
| Request Disconnect (RD)              | 0101 0011 | 53  | Command notifies the primary station that the secondary station has a need for a DISC command.  |
| Unnumbered Acknowl-<br>edgement (UA) | 0111 0011 | 73  | Command affirms a response to an SNRM or SIM command.   |

| Command             |           |     |                                     |  |  |
|---------------------|-----------|-----|-------------------------------------|--|--|
| Requests            | Binary    | Hex | Function                            |  |  |
| Frame Reject (FRMR) | 1001 0111 | 97  | Command rejects an invalid command. |  |  |

# **Supervisory Format: (Bits 6,7=01)**

| Commands                   | Control<br>Field | Function  |
|----------------------------|------------------|---|
| Receive Ready (RR)         | RRRP 0001        | Command indicates the originating station is ready to receive.  |
| Receive Not<br>Ready (RNR) | RRRP 0101        | Command indicates a temporary busy condition in which no frames requiring buffer space can be accepted. |
| Reject (REJ)               | RRRP 1001        | Command requests the transmission or re-transmission of sequenced information.                          |

SSS or N(S) Transmit station send sequenced number.

Poll (command/request from primary) or

Final (response from secondary)

RRR or N(R) Transmit station receive sequenced number.

# Information Format: (Bit 7=0)

| Commands | Control<br>Field | Function |  |
|----------|------------------|----------|--|
|          | DDDD CCCO        |          |  |

RRRP SSS0

SSS or N(S) Transmit station send sequenced number. Poll (command/request from primary) or Final (response from secondary)

RRR or N(R) Transmit station receive sequenced number.

# 2-Byte Control Field (Modulo 128)

### **Unnumbered Format**

All unnumbered frames are 1 byte in length.

# **Supervisory Format**

| Commands                   | Control Field<br>Byte 0 | Control Field<br>Byte 1 |  |

| 1.          | Pseudo read     |   |
| 1           | Pseudo read end | • |

# **EP Timeout Routine Descriptions**

Table 7-1 (Page 1 of 2). EP Timeout Routine Descriptions

| Offset <sup>1</sup> | Type of Timeout          |
|---------------------|--------------------------|
| x'00'               | No active timer          |
| x'04'               | "FROM" interface Setmode |
| x'08'               | Setmode command continue |
| x'0C'               | "TO" interface Setmode   |
| x'10'               | Emulate mode Write       |
| x'14'               | SS lost transmit clock   |
| x'18'               | Emulate BSC Read         |
| x'1C'               | Autocall                 |
| x'20'               | Emulate BSC Adprep       |
| x'24'               | TTY EOT                  |
| x'28'               | Emulate mode DSR         |
| x'2C'               | Unit Check               |
| x'30'               | Emulate Poll             |
| x'34'               | Transparent Write        |
| x'38'               | SS Read/Inhibit          |
| x'3C'               | Reply timeout            |
| x'40'               | Text timeout             |
| x'44'               | Addl. 25.6 repeat T/O    |
| x'48'               | Emulate Xparent Wait     |

Table 7-1 (Page 2 of 2). EP Timeout Routine Descriptions

| Offset <sup>1</sup> | Type of Timeout             |
|---------------------|-----------------------------|
| x'4C'               | BSC Transmit timeout        |
| x'50'               | SS Line Quiet               |
| x'54'               | Equipment Check             |
| x'58'               | SS Transmit                 |
| x'5C'               | Timefactor extra time loop  |
| x'60'               | BSC transparent wait        |
| x'64'               | F5 error recovery           |
| x'68'               | Scanner Setmode             |
| x'6C'               | Reset-N/Reset-D             |
| x'70'               | SS Initial Select           |
| x'74'               | SS lost transmit clock      |
| x'78'               | Postponed processing resume |
| x'7C'               | Scanner trace (SIT)         |
| x'80'               | Wrap Reset-D                |
| x'84'               | Wrap Initial                |
| x'88'               | Wrap loop control           |
| x'8C'               | Wrap final Reset-X          |
| x'90'               | Wrap control leads          |
| x'94'               | Wrap Receive                |
| x'98'               | Wrap Transmit               |
| x'9C'               | Wrap Flush command          |
| x'A0'               | Emulate CTS                 |
| x'A4'               | Channel adapter             |
| x'A8'               | Prepare (nohalt)            |
| x'AC'               | Auto baud detect            |
| x'B0'               | V.25 Bis Call Request       |
| x'B4'               | Channel status              |
| x'B8'               | Enable command              |

<sup>&</sup>lt;sup>1</sup> The timeout routine offset appears in the CCBTMADR field of the EP character control block (CCB) and in byte 3 of X'41' entries of the EP line trace.

**Used After Add** Instructions

| Extended Code | Meaning            | Equivalent Machine Instruction |
|---------------|--------------------|--------------------------------|
| во т          | Branch on Overflow | BCL T                          |

Note: In the BBE extended code, P represents an absolute expression that specifies a bit in byte 0 or 1 of a register. The value of the expression must be between 0 and 15. All other keyword values have the same meaning as in the standard machine instruction format.

### **Instruction Decode**

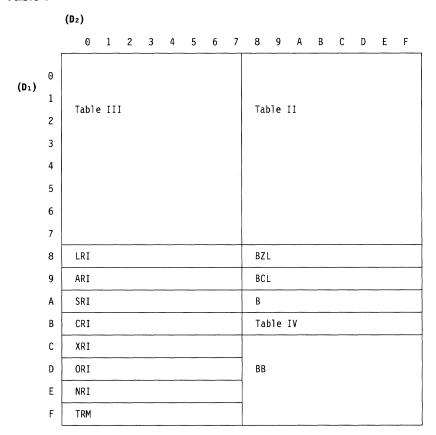

These charts can be used to decode the 4-digit hexadecimal representation of a 3745 machine instruction.

Use the chart as follows:

- 1. Locate the first digit (D1) of the instruction in hexadecimal in the column of numbers on the left side of
- 2. Locate the second digit of the instruction in the row of numbers at the top of Table I.
- 3. Go to the intersection of the column and row represented by the two numbers. You will find either the mnemonic or a reference to Table II, Table III, or Table IV.

Tables II and IV require that you locate digit 3 (D<sub>3</sub>) only of the instruction in the row of digits at the top of each chart. Follow the instructions for Table I to use Table III, substituting digit 3 (D<sub>3</sub>) and digit 4 (D<sub>4</sub>). Table V is entered from Table III only when D<sub>3</sub>=7 and D<sub>4</sub>=0.

### Table I

### Table II

| _ | (D3)<br>0 | 1  | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | Α | В | С | D   | E | F |  |

**Legend:** \* = Instructions that can alter condition latches.

<sup>1 =</sup> Negative displacement0 = Positive displacement

Section 8. Instruction Set for the 3745 **8-5** 

#### Notes:

- 1. Add two cycles if the data is not on a fullword boundary.
- 2. Add two cycles if the data is not on a fullword boundary.
- 3. If register 0 (IAR) is specified as R1, a branch occurs to the address formed in register 0 and the condition latches remain unchanged.
- 4. If the next instruction executed does not reference storage, the number of cycles required is as follows: ST=1, STH=2, STC=2, and STCT=2. Add one cycle if the base register=0.
- 5. The total time required for IOH/IOHI is as follows:
  - IOH/IOHI for the channel adapter=4.57 microseconds
  - IOH/IOHI for the communications scanner processor=10.40 microseconds.
- 6. One cycle with the following exceptions:
  - Two cycles for OUT X'78'
  - Three cycles for OUT X'70', X'73', X'7B', X'7C', X'7D', X'7E', or X'7F'
  - Three cycles for the output using the IAR as an external register
  - Five cycles for OUT X'74'.
- 7. Two cycles with the following exceptions:
  - One cycle for IN X'74' and the input using the IAR as an external register.
  - Four cycles for IN X'70'.
  - Add three cycles if the general register addressed is the IAR.
  - Two cycles for OUT X'78'.
- 8. Add one cycle if the base register=0.

# Section 9. IOH/IOHI Registers

Following are byte expansions for IOH/IOHI registers.

# **Channel Adapter IOH/IOHI Registers**

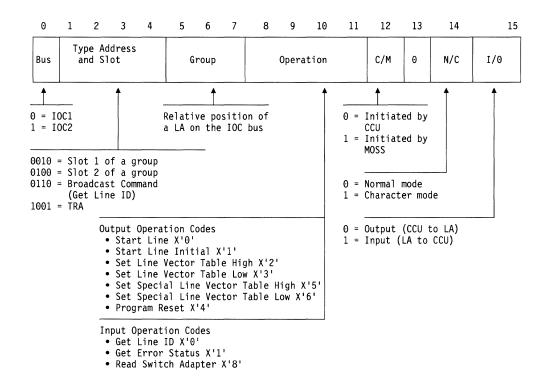

# R2 Register for IOH or Second Halfword for IOHI for the 3745

(R2 contents at TA time)

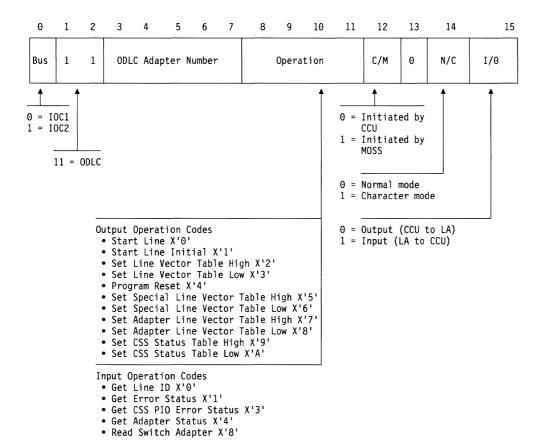

# Line Adapter IOH/IOHI Registers for the 3745

(TA field)

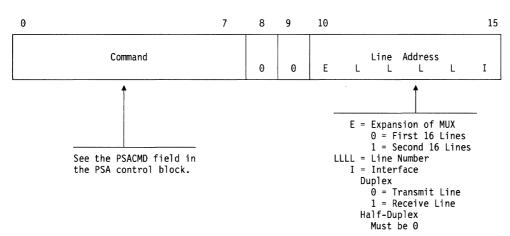

R1 register for IOH by operation code or R register for IOHI by operation code

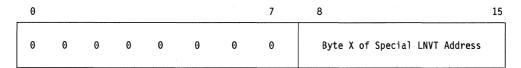

R1 register for IOH by operation code or R register for IOHI by operation code

# Start Line (OP 0—Out) or Start Line Initial (OP 1—Out)

(TD field)

# Set Line Vector Table Low (OP 3—Out)

| 0 |                        | 7 | 8                      | 15 |
|---|------------------------|---|------------------------|----|
|   | Byte 0 of LNVT Address |   | Byte 1 of LNVT Address |    |

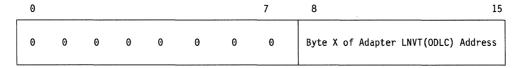

# Set Special Line Vector Table High (OP 5—Out)

| 0 |   |   |   |   |   |   | 7 | 8                           | 15   |
|---|---|---|---|---|---|---|---|-----------------------------|------|
| 0 | Θ | 0 | Θ | 0 | 0 | Θ | 0 | Byte X of Special LNVT Addr | ress |

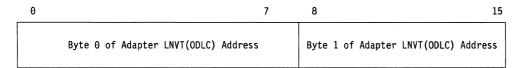

# **Set Special Line Vector Table Low (OP 6—Out)**

| 0 .                            | 7 | 8                              | 15 |
|--------------------------------|---|--------------------------------|----|
| Byte 0 of Special LNVT Address |   | Byte 1 of Special LNVT Address |    |

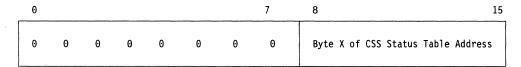

# Set Adapter Line Vector Table High (OP 7—Out)

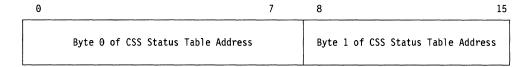

# Set Adapter Line Vector Table Low (OP 8—Out)

# Set CSS Status Table Low (OP A—Out)

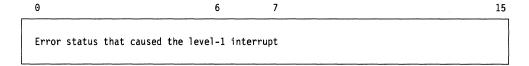

# Get Line ID (OP 0—In)

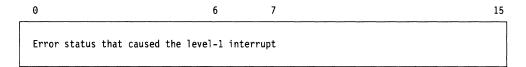

0 6 7 15

LNVT offset for the line interface causing the level-2 interrupt

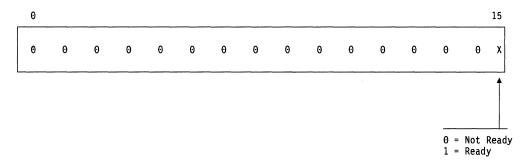

# Get Error Status (OP 1—In)

# Get CSS PIO Error Status (OP 3—In)

# Get Adapter Status (OP 4—In)

# Section 10. Macro Supervisor Call (SVC) Codes

An SVC code is generated whenever level 5 uses the supervisor. The SVC linkage between levels 5 and 4 consists of an EXIT instruction (X'0070'), the SVC code, flags, communication bits, parameters, and space for output variables. Bits 0–6 of the SVC code field contain the SVC identifier and bit 7 contains the one-parameter flag. For a layout of the linkage generated by the RNSVC macro, refer to *NCP Customization Guide*.

To determine the macro from a dump, enter the following table with the SVC code field value.

| Example: | Dump contains | X'0070 21xx xxx'       |
|----------|---------------|------------------------|
|          |               |                        |
| EXIT     |               | Enter table, find CALL |

| SVC Code<br>Field (Hex)<br>(Bit 7=0) | SVC Code<br>Field (Hex)<br>(Bit 7=1) | Identifier | Macro             |
|--------------------------------------|--------------------------------------|------------|-------------------|
| 02                                   | 03                                   | SVC01      | LEASE             |
| 04                                   | 05                                   | SVC02      | RELEASE           |
| 06                                   | 07                                   | SVC03      | CHAIN             |
| 08                                   | 09                                   | SVC04      | UNCHAIN           |
| 0A                                   | 0B                                   | SVC05      | SCAN              |

# Section 11. Character Mode Primary Control Field (PCF) State Diagrams

Following are Character Mode Primary Control Field (PCF) state diagrams.

## **PCF Start-Stop Line Interface**

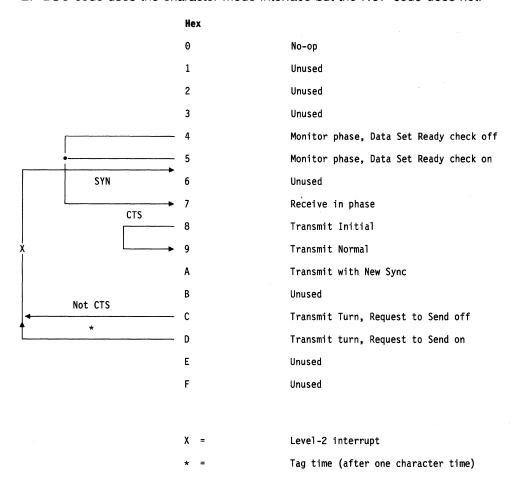

#### **Line Control Definition (LCD)**

#### Hex

0 SS 9/6 1 2 SS 8/5 3 Auto call 4 SS 9/7 5 SS 10/7 6 SS 10/8 7 SS 11/8, 2848 8 Unused 9 SDLC 8-bit byte length Α Reserved В Reserved С **BSC EBCDIC** D **BSC ASCII** Ε Reserved Unused

#### **PCF BSC Line Interface**

EP BSC code uses the character mode interface but the NCP code does not.

- 1. Displayed on the 2260 as the New Line (<) symbol. Causes a carriage return and line feed on the 1050
- 2. Displayed on the 2260 as the EOM (—) symbol. Prints on the 1050 Model 4 Printer as the exclamation mark (!).
- 3. Displayed on the 2260 as the Check (•) symbol. Prints on the 1050 Model 4 Printer as the quote sign(").
- 4. Displayed on the 2260 as the Start MI (>) symbol. Prints on the 1050 Model 4 Printer as the cent sign

#### **ASCII Character Code (Odd Parity) for Binary Synchronous** Communication

- During transmit, NCP uses the EBCDIC X'38' character for internal control to signal the end-of-data condition (count exhausted). If NCP is currently sending "answer back" or "prompt," it transmits an X-On character (EBCDIC X'11'); otherwise, NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- $^{\star\star}$  NCP sets the pad flag to transmit one character time of all mark bits.
- \*\*\* Character is not stored.

### Notes:

[ ] = In only.

() = Out only.

See page 12-29 for all notes.

- During transmit, NCP uses the EBCDIC X'38' character for internal control to signal the end-of-data condition (count exhausted). If NCP is currently sending "answer back" or "prompt," it transmits an X-On character (EBCDIC X'111'); otherwise, NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- \*\* NCP sets the pad flag to transmit one character time of all mark bits.
- \*\*\* Character is not stored.

## **Notes for All Data Interchange Code Tables**

## Notes:

- 1. The user specifies the parity of the transmitted data as (1) even parity, (2) odd parity, (3) mark parity (parity bit always a 1), or (4) space parity (parity bit always a 0) by coding the PARGEN keyword of the GROUP definition statement. A table is provided for each type of parity specified. Normally TWX parity is even.
- 2. The three DIC translate tables apply to both DIC1 and DIC3 character sets except where noted. The DIC1 translate tables are associated with all TWX lines for which CODE=DIC1 is specified on the LINE definition statement or corresponding GROUP or MTALCST definition statement. The DIC3 translate tables are associated with all TWX lines for which CODE=DIC3 is specified on the MTALCST definition statement, LINE definition statement, or corresponding GROUP statement. The receive and transmit tables are shown on the same DIC table. Receive only (IN) entries are enclosed by [] while transmit only (OUT) entries are enclosed by (). Entries that apply to both receive and transmit are not enclosed.
- 3. The transmit DIC1 and DIC3 tables translate all EBCDIC code values between X'00' and X'FF' that are not shown, or noted, to a TWX colon, the same as the translation of the EBCDIC colon (X'7A'). The receive DIC1 and DIC3 tables translate all TWX code values not shown in the PDF code, or noted, to an EBCDIC semicolon (X'5F'), the same as the translation of a TWX semicolon.
- 4. The DIC3 receive translate table translates the TWX linefeed character to an EBCDIC newline character (X'15'). The DIC1 and DIC3 transmit translate tables translate the EBCDIC newline character to a TWX linefeed character.
- 5. The DIC1 receive translate table translates the TWX linefeed character to an EBCDIC linefeed character (X'25'). The DIC1 and DIC3 transmit translate tables translate the EBCDIC linefeed character to a TWX linefeed character.
- 6. The receive DIC1 and DIC3 translate tables translate the TWX carriage return (CR) character to an EBCDIC CR character (X'0D'). In addition, the DIC3 table treats the CR the same as X-Off (see note 7).
- 7. The receive DIC1 translate table translates the TWX CTRL-X character to an EBCDIC semicolon (X'5E'). The receive DIC3 translate table translates the TWX CTRL-X character to an EBCDIC Cancel (X'18') and treats the CTRL-X the same as X-Off. (If the CHAREC keyword of the GROUP definition statement specifies CTRL-X as an end control character, the CTRL-X ends the receive type command with EOT received status. If CHAREC specifies CTRL-X is not to be recognized as an end-control character, CTRL-X is treated as data.)
- 8. The DIC3 receive translate table translates the TWX backarrow character (underscore on some TWX terminals) to an EBCDIC backspace character (X'16').
- 9. The DIC1 receive translate table translates the TWX backarrow character (underscore on some TWX terminals) to an EBCDIC underscore character (X'6D').

## **ASCII Character Code for TWX with Even Parity**

See notes 1 and 2 on page 12-38.

### Notes:

() = Out only.

See page 12-38 for all notes.

- During transmit, NCP uses the EBCDIC X'38' character for internal control to signal the end-ofdata condition (count exhausted). If NCP is currently sending "answer back" or "prompt," a DC1 character is sent; otherwise, NCP sets the pad flag to transmit one character time of all mark bits
- \*\* NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- This character appears on terminal keyboards as  $\Lambda$  or  $\neg$  or  $\uparrow$ .
- † EBCDIC underscore.
- †† Character is not stored.
- ††† For the EBCDIC character X'37' (EOT), a X'84' (EOT) is transmitted. If this character is sent, the TWX (33/35) will physically disconnect.

## **ASCII Character Code for TWX with Odd Parity**

See notes 1 and 2 on page 12-38.

### Notes:

( ) = Out only.

See page 12-38 for all notes.

- \* During transmit, NCP uses the EBCDIC X'38' character for internal control to signal the end-of-data condition (count exhausted). If NCP is currently sending "answer back" or "prompt," a DC1 character is sent; otherwise, NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- \*\* NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- \* This character appears on terminal keyboards as  $\wedge$  or  $\neg$  or  $\uparrow$ .
- † EBCDIC underscore.
- †† Character is not stored.
- ††† For the EBCDIC character X'37' (EOT), a X'84' (EOT) is transmitted. If this character is sent, the TWX (33/35) will physically disconnect.

## **ASCII Character Code for TWX with Mark Parity**

See notes 1 and 2 on page 12-38.

### Notes:

() = Out only.

See page 12-38 for all notes.

- \* During transmit, NCP uses the EBCDIC X'38' character for internal control to signal the end-of-data condition (count exhausted). If NCP is currently sending "answer back" or "prompt," a DC1 character is sent; otherwise, NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- $^{\star\star}$  NCP sets the pad flag to transmit one character time of all mark bits (X  $^{\prime}$  FF  $^{\prime}$  ).
- \* This character appears on terminal keyboards as  $\wedge$  or  $\neg$  or  $\uparrow$ .
- † EBCDIC underscore.
- †† Character is not stored.
- ††† For the EBCDIC character X'37' (EOT), a X'84' (EOT) is transmitted. If this character is sent, the TWX (33/35) will physically disconnect.

## **ASCII Character Code for TWX with Space Parity**

See notes 1 and 2 on page 12-38.

### Notes:

() = Out only.

See page 12-38 for all notes.

- During transmit, NCP uses the EBCDIC X'38' character for internal control to signal the end-ofdata condition (count exhausted). If NCP is currently sending "answer back" or "prompt," a DC1 character is sent; otherwise, NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- \*\* NCP sets the pad flag to transmit one character time of all mark bits (X'FF').
- This character appears on terminal keyboards as  $\Lambda$  or  $\neg$  or  $\uparrow$ .
- † EBCDIC underscore.
- †† Character is not stored.
- ††† For the EBCDIC character X'37' (EOT), a X'84' (EOT) is transmitted. If this character is sent, the TWX (33/35) will physically disconnect.

## Notes for All ASCII Character Code Tables for TWX

### Notes:

- 1. The user specifies the parity of the transmitted data as (1) even parity, (2) odd parity, (3) mark parity (parity bit always a 1), or (4) space parity (parity bit is always a 0) by coding the PARGEN keyword of the GROUP definition statement. A table is provided for each type of parity specified.
- 2. The three ASCII translate tables are associated with all TWX lines for which CODE=ASCII is specified in the MTALCST definition statement, LINE definition statement, or corresponding GROUP definition statement.
- 3. For transmit, all EBCDIC code values between X'00' and X'FF' not shown are translated to an EBCDIC colon (X'7A').
- 4. For receive, all ASCII code values not shown in the PDF column are translated to an EBCDIC semicolon (X'5E'), the same as the translation of an ASCII semicolon. The ASCII parity bit in PDF bit 0 is ignored for translation.

# Interface Addressing Section 13. Interface Addressing 13-1 Conversions between the RLN and LNVT Entry Address for Non-ODLC 13-3 Conversions between the RLN and LNVT Entry Address for ODLC 13-5

"Restricted Materials of IBM" Licensed Materials – Property of IBM

## Section 13. Interface Addressing

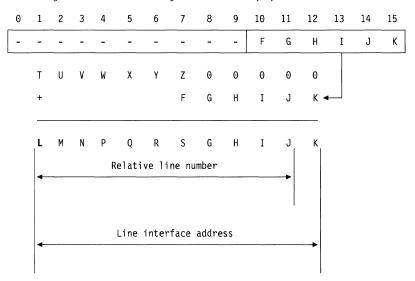

Non-ODLC:

R2 register for IOH or Second halfword for IOHI (TA)

The number represented by the bits ABCDE is an index into the adapter information table control block (AIT). This number is multiplied by the length of an AIT entry (X'20') and added to the beginning address of the LA segment of the AIT (CXTB1LA). The first relative line number on this LA, B'TUVWXYZ0000', can be attained from the AIT entry.

R1 register for IOH or R register for IOHI (TD)

The 32 line adapters (LAs) are arranged in groups and slots within those groups. The tag address (TA) templates may be formed using the following information. Bit 0 is the bus indicator bit and is set to 0 if the LA is on bus 1 (IOC1) or 1 if the LA is on bus 2 (IOC2). Bit 2 is the slot bit. Bit 3 is set to be the opposite of bit 2. Bits 5-7 are the group bits. Bits 1, 4, and 8-15 are set up according to the IOH command desired.

| Group  | 0 0 0  | Group  | 0 0 1  |       | Group  | 100    | Group  | 101    |

## Conversions between the RLN and LNVT Entry Address for Non-ODLC

Conversion from relative line number (RLN) to line vector table (LNVT) entry address:

LNVT entry<sub>16</sub> = 
$$(RLN \times 8)_{16}$$
 + (beginning of LNVT<sub>16</sub>)

- Half duplex (HDX) line's interface address = LNVT entry
- Full duplex transmit (FDX XMT) leg's interface address = LNVT entry
- Full duplex receive (FDX RCV) leg's interface address = LNVT entry + 4

Conversion from LNVT entry address to RLN:

$$RLN_{16} = (LNVT entry_{16} - beginning of LNVT_{16}) \div 8$$

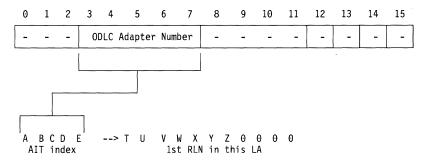

The value of the RLN may need to be truncated.

### Notes:

- 1. The beginning of the LNVT for the 3745 is X'1000'.
- 2. The starting address may be changed by the Set Line Vector Table High/Low commands.

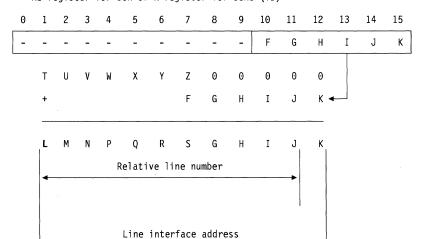

### ODLC:

### R2 register for IOH or Second halfword for IOHI (TA)

The number represented by the bits  $\mbox{ABCDE}$  is an index into the adapter information table control block (AIT). This number is multiplied by the length of an AIT entry (X'20') and added to the beginning address of the ODLC adapters segment of the AIT (CXTLIME). The first relative line number on this ODLC adapter, B'TUVWXYZ0000', can be attained from the AIT entry.

R1 register for IOH or R register for IOHI (TD)

## Conversions between the RLN and LNVT Entry Address for ODLC

Conversion from relative line number (RLN) to the ODLC line vector table (LNVT) entry address:

LNVT (ODLC) entry<sub>16</sub> = 
$$((RLN - 780) \times 8)_{16}$$
 + (beginning of LNVT(ODLC)<sub>16</sub>)

- Full duplex transmit (FDX XMT) leg's interface address = LNVT (ODLC) entry
- Full duplex receive (FDX RCV) leg's interface address = LNVT (ODLC) entry + 4

Conversion from LNVT (ODLC) entry address to RLN:

$$RLN_{16} = ((LNVT (ODLC) entry_{16} - beginning of LVNT (ODLC)_{16}) \div 8) + 780_{16}$$

The value of the RLN may need to be truncated.

Note: The beginning of the LNVT (ODLC) is pointed to by the SYSOLNVT field in the FAX.

# Record Maintenance Statistic (RECMS) Request/Response Unit (RU) Formats

| Section 14. Record Maintenance Statistic (RECMS) Request/Response Unit (RU) Formats | 14-1 |
|---|------|

| Intensive Mode Record for SNA Recoverable Errors                                    | 4-20 |
| Pseudo Last Intensive Mode Record   | 4-23 |

"Restricted Materials of IBM" Licensed Materials – Property of IBM

## Section 14. Record Maintenance Statistic (RECMS) Request/Response Unit (RU) Formats

The network control program sends unsolicited RECMS PIUs to the access method to record the following conditions:

- BSC and Start Stop device or line errors
- BSC and Start Stop station statistics
- SNA link permanent errors
- · SNA station permanent errors
- SNA statistics
- Intensive-mode record for SNA recoverable errors
- · Pseudo last intensive-mode record.

The access method records the RECMS record on SYS1.LOGREC. The IBM service representative or customer can use IFCERP0 to edit and print SYS1.LOGREC to obtain the desired records.

NCP RECMS records are identified by the second 2 bytes of the RU in the FID1 PIU. For RECMS records, RU byte 1=X'03' and RU byte 2=X'81'. Bytes 3 and 4 of the RU contain the network address of the failing unit, and byte 5 is the beginning of the RECMS record.

The text portion of the RECMS records consists of a field of up to 101(65) bytes. The third byte of the field is the recording mode byte, which is used to differentiate among the types of NCP RECMS records. The fourth byte, the record ID byte, indicates the type of the communication controller.

NCP issues the BDCRP macro for the following reasons:

- To obtain a check record pool (CRP) unit to insert information pertaining to the error that occurred.
- To cause a box event record (BER) to be built.
- To send the BER to MOSS where the information is stored on a diskette.

The BER is not sent to the host. The operator or IBM service representative may obtain the event information by executing console procedures. See "Box Event Record" in Volume 1 Section 1 for the formats of the event records when they are in the CRP.

**Note:** The miscellaneous data recorder (MDR) record is a subset of the RECMS record. NCP code may refer to a RECMS record by the term MDR record.

## **Permanent BSC and Start Stop**

The line error recorder routine (CXDILER) and link problem determination aid (LPDA) terminator (CXDKCET) build this RECMS RU.

Indicates the control block field from which this RECMS-RU field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

<sup>\*\*</sup> This field contains the transmit BLU command for a duplex link and X'00' for a half-duplex link.

<sup>\*\*\*</sup> Intensive mode flags:

X'00' Normal intensive mode record (not the last IMR)

X'01' Last IMR when the last counter has reached the specified recording limit.

## Byte Expansions

# Section 15. Record Formatted Maintenance Statistic (RECFMS) Request/Response Unit (RU) Formats

The network control program sends either an unsolicited request RECFMS PIU or a positive reply RECFMS PIU to an REQMS (solicited request) to the access method to record one or more of the following:

- Alert message
- · Summary error data
- Session trace data (request or reply)
  - Resource type=PU type 1 or 2
  - Resource type=NCP (PU type 4)
  - Resource type=LU
  - Resource type=Pre-SNA (BSC/SS)
- · Reply to an enable or inhibit session trace REQMS
- Engineering change (EC) change level data
- Link problem determination aid (LPDA) data.

NCP RECFMS records are identified by RU bytes 1 and 2. For RECFMS records, RU byte 1=X'03' and RU byte 2=X'84'. Bytes 3 and 4 of the RU contain the resource identification, and byte 5 is the beginning of the RECFMS record. RU byte 7 is the RECFMS type that is used to differentiate between the types of NCP RECFMS records.

# Alert Message

- NCP or PEP only.
- An unsolicited request.
- The MOSS-down or -offline module, CXAMDNOF, builds the MOSS-down alert RECFMS PIU and sends it to all owning SSCPs (user action code X'01').
- All other alert RECFMS PIUs (user action codes other than X'01') are built by MOSS and sent to all owning SSCPs using or through NCP (CXAMPIUI).

RECFMS offset 55(37) 0(0) RU1BT0 Network X'41' services 1(1) 2(2) 3(3) RU1BT1 RU1RC2 RU1NA Physical maintenance Request code Alert originator PU X'84 X'03' element address (RECFMS) services 5(5) 7(7) 8(8) RÚ1ŘMTYP RU1RFB1 RECFMS RU1REMS Block ID X'1000'=bytes 3 and 4 (PSBMIS1)\* type (contains a PU.T4 address) X 00' 9(9) 12(C) RU1RFB2 RU1RFB3 RU1RFB4 Box serial number Reserved (PSBMIS1)\* (PSBMIS2)\* 13(D) 16(10) 14(E) 15(F) Reserved Alert Alert type Minor (major probable probable format X'40' cause) cause 17(11) 18(12) 19(13) 20(14) User action User action Reserved Reserved qualifier (first) code\*\* vector length 21(15) 22(16) - nFirst user action qualifier (UAQ) UAQID First UAQ message n+1 n+2 (n+3) - mUAQ ID Last UAQ message Vector length End of appended vectors X'00'

<sup>\*</sup> Indicates the control block field from which this RECFMS-RU field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

<sup>\*\*</sup> See Table 15-1 on page 15-3 for these values.

Table 15-1. Alert Message Table for RECFMS Type 00

<sup>\*</sup> Indicates the control block field from which this RECFMS-RU field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

## Notes:

- 1. Expanded to a halfword (2 bytes) and moved from another location.
- 2. Correct SNA name.

# **Session Trace Data (PU Type 4—NCP)**

## Resource Type (ST1RETYP)=X'03' (PU Type 4—NCP)

- An unsolicited request or a reply to a REQMS request type (RU1RMTYP)=X'04' (session trace) and request type (ST10PT)=X'01' (request data).
- The session trace reporter (CXDKSTR) builds this RECFMS.

<sup>\*</sup> Indicates the control block field from which this RECFMS-RU field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

Note: These fields are set to zero for non-PU type 1 LUs.

# **Session Trace Data (BSC/SS)**

## Resource Type (ST1RETYP)=X'05' Pre-SNA (BSC/SS)

• An unsolicited request or a reply to a REQMS request type (RU1RMTYP)=X'04' (session trace) and request type (ST10PT)=X'01' (request data).

> RECFMS offset 55(37)

• The session trace reporter (CXDKSTR) and CXDISTC build this RECFMS.

# **Enable Session Trace or Inhibit Session Trace Request Type**

- A reply to record formatted maintenance statistics (REQMS) request types X'02', X'03', X'04', or X'05'
- Built by the session trace reporter (CXDKSTR).

### **Engineering Change (EC) Level Data**

MOSS requests buffers from NCP, then builds and sends this RECFMS PIU, using NCP (CXAMPIUI), to the originator of the requesting REQMS type X'05'.

# Network Management Vector Transport (NMVT) Request/Response Unit (RU) Formats

| -  | Section 16. Network Management Vector Transport (NMVT) Request/Response Unit (RU)  |       |
|----|--|-------|
| -  | Formats  | 16-1  |
| 1  | Summary of NMVT RU Formats   | 16-1  |
| ĺ  | NMVT RU Header Format  | 16-5  |
| ĺ  | Alert Due to a Logical Frame Relay Line Failure Caused by a Physical Frame Relay Line Failure  | 16-6  |
| i  | Alert Due to a Logical Frame Relay Line Failure Caused by Forced Deactivation of a Physical Fram   | е     |
| i  | Relay Line   |       |
| i  | Alert Due to Frame Relay DLCI Mismatch between Adjacent Frame Relay Nodes  |       |
| i  | Alert Due to LMI Configuration Mismatch between Adjacent Frame Relay Nodes   |       |
| i  | Alert due to Frame Relay Subport Failure Caused by a Deleted DLCI  |       |
| i  | Alert due to Frame Relay Subport(s) Failure Caused by Inactive DLCI  |       |
| i  | Alert due to LMI Error Threshold Reached on Frame Relay Physical Line  |       |
| i  | Alert Due to Frame Relay FRSE Subport Failure Caused by the Deletion of its FRSE Subport   |       |
| ï  | Partner  | 16-14 |
| 1  | Alert Due to FRSE Substitute Subport Failure Caused by LMI Configuration Mismatch  |       |
| 1  | Frame-Relay Microcode Mismatch Alert   |       |
| 1  | NCP ETSS CSMA/CD LAN No-Carrier Generic Alert  |       |
|    | Down-Level ESS Adapter Microcode Alert   |       |
|    | Owning TCP/IP Host Down Alert  |       |
|    | Bad NCPROUTE Datagram Alert  |       |
|    | Hello Threshold Reached Alert  |       |
| 1  | NCPROUTE Connection Activation Failed Alert  |       |
| 1  | Alert Due to a Blocked Virtual Route   |       |
| 1  | Alert Due to a Virtual Route Out-of-Sequence   |       |
| 1  | Alert due to NCST Receiving a PIU which Violates a SNA Protocol  |       |
| 1  | Alert due to NCST Logic Error  |       |
| 1  | Alert Generated by NTRI (Physical Link)  |       |
|    | Alert Generated by NTRI (Logical Link)   |       |
| 1  | Alert Due to a Modem Dial-Out Failure (NCP Case), SNA Protocol Error, NCST Logic Error, Invalid  | 10-20 |
| 1  | Dial Digits, or Callout Contention   | 16-29 |
| 1  | Alert Due to a Modem Dial-Out Failure (NEO Case)   |       |
| 1  | ODLC Token-Ring Logical Resource Failure Caused by Failure of the Physical Link  |       |
| 1  | ODLC Token-Ring Cognour Resource Failure Caused by Failure of the Friysical Link   |       |
|    | ODLC Token-Ring CONNOUT Failure - Invalid Blat Bigits  |       |
| 1  | ODLC Token-Ring COMMOD Failure - Physical Resource Not Operational   |       |
|    | ODLC Token-Ring Notify Call Indication EDFSA Rejection Due to No Edgical Resources Available ODLC Token-Ring CONNOUT Failure - Incoming Call Collision | 16-35 |
| 1  | ODLC Permanent Station/Link Error Alert  | 16-36 |
|    | ODLC Permanent Link Error Alert - ESCA Forced Deactivation   | 16-37 |
| 1  | Usage Tier Exceeded Generic Alert  | 16-38 |
| 1  | Alert Threshold for Dynamic Control Blocks Reached   | 16-39 |
|    | Buffers for Dynamic Control Blocks Depleted  | 16-40 |
|    | Allocation for Dynamic CBs failed: Too Close to Slowdown   | 16-41 |
| 1  | First Dynamic Control Block Allocated  | 16-41 |
| 1  | Allocation for Control Block Failed due to Genned Limit  |       |
| 1  | Allocation for Control Block Falled due to Germed Limit  |       |
| 1  |  |       |
| 1  | LK-EVENT Reply Due to a Line Permanent Error on a Tailed Line  |       |
| 1  | •  |       |
| -1 | LK-EVENT Reply Due to a Station Permanent Error on a Tailed SDLC Line  | 10-48 |

| 1      | LK-EVENT Reply Due to a BSC Terminal Permanent Error on a Non-Tailed BSC Line                      | 16-50  |

## Section 16. Network Management Vector Transport (NMVT) Request/Response Unit (RU) Formats

### **Summary of NMVT RU Formats**

NCP sends unsolicited reply NMVT PIUs to either the NetView program or Network Problem Determination Aid (NPDA) or solicits positive reply NMVT PIUs or error reply NMVT PIUs and responses. Table 16-1 lists, by major vector key, the NMVT requests that are received and the replies that are sent by NCP. The RU formats for these are located after the table. RU formats for the subvectors and their subfields are located at the end of this section. The number in the second column is the cross reference to the request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. The cross-reference number can be found in the note section preceding each RU format.

Table 16-1 (Page 1 of 4). NMVT Requests and Replies for NCP

| Major Vector<br>Key | Cross<br>Reference | NMVT PIU Description   | Page  |
|---------------------|--------------------|--|-------|
| X'0000'             | 47                 | Alert due to a Logical Frame-relay Line Failure Caused by a Physical Frame-relay Line Failure                | 16-6  |
| X'0000'             | 48                 | Alert due to a Logical Frame-relay Line Failure Caused by Forced Deactivation of a Physical Frame-relay Line | 16-7  |
| X'0000'             | 52                 | Alert due to Frame-relay DLCI Mismatch between Adjacent Frame Relay Nodes                                    | 16-8  |
| X'0000'             | 53                 | Alert due to LMI Configuration Mismatch between Adjacent Frame Relay Nodes                                   | 16-9  |
| X'0000'             | 54                 | Alert due to Frame-relay Subport Failure Caused by a Deleted DLCI  | 16-10 |
| X'0000'             | 55                 | Alert due to Frame-relay Subport(s) Failure Caused by Inactive DLCI  | 16-12 |
| X'0000'             | 56                 | Alert due to LMI Error Threshold Reached on Frame-relay Physical Line  | 16-13 |
| X'0000'             | 57                 | Alert due to Frame-relay FRSE Subport Failure Caused by the Deletion of its FRSE Subport Partner             | 16-14 |
| X'0000'             | 58                 | Alert due to FRSE Substitute Subport Failure Caused by LMI Configuration Mismatch                            | 16-15 |
| X'0000'             | 91                 | Frame-relay Microcode Mismatch Alert   | 16-16 |
| X,0000,             | 49                 | NCP ETSS CSMA/CD LAN No-carrier Generic Alert  | 16-17 |
| X'0000'             | 65                 | Down-Level ESS Adapter Microcode Alert   | 16-18 |
| X'0000'             | 66                 | Owning TCP/IP Host Down Alert  | 16-19 |
| X'0000'             | 67                 | Bad NCPROUTE Datagram Alert  | 16-20 |
| X'0000'             | 88                 | Hello Threshold Reached Alert  | 16-21 |
| X'0000'             | 89                 | NCPROUTE Connection Activation Failed Alert  | 16-22 |
| X,0000,             | 51                 | Alert due to a Blocked Virtual Route   | 16-23 |
| X'0000'             | 72                 | Alert due to a Virtual Route Out-of-Sequence   | 16-24 |
| X'0000'             | 70                 | SNA Protocol Error Alert   | 16-25 |

Table 16-1 (Page 2 of 4). NMVT Requests and Replies for NCP

| Major Vector<br>Key | Cross<br>Reference | NMVT PIU Description   | Page  |
|---------------------|--------------------|--|-------|
| X'0000'             | 71                 | NCST Logic Error Alert   | 16-26 |
| X'0000'             | 1 .                | Alert Generated by NTRI (Physical Link)  | 16-27 |
| X'0000'             | 3                  | Alert Generated by NTRI  | 16-28 |
| X'0000'             | 4a                 | Alert due to a Modem Dial-Out Failure (NCP Case)   | 16-29 |
| X'0000'             | 4b                 | Alert due to a Modem Dial-Out Failure (NEO Case)   | 16-30 |
| X'0000'             | 73                 | ODLC Token-ring Logical Resource Failure Caused by Failure of the Physical Link                            | 16-3  |
| X'0000'             | 74                 | ODLC Token-ring CONNOUT Failure - Invalid Dial Digits  | 16-3  |
| X'0000'             | 75                 | ODLC Token-ring CONNOUT Failure - Physical Resource Not Operational  | 16-3  |
| X'0000'             | 76                 | ODLC Token-ring Notify Call Indication LDPSA Rejection due to No Logical Resources Available               | 16-3  |
| X'0000'             | 77                 | ODLC Token-ring CONNOUT Failure - Incoming Call Collision  | 16-3  |
| X'0000'             | 78                 | ODLC Permanent Station/Link Error Alert  | 16-3  |
| X'0000'             | 79                 | ODLC Permanent Link Error Alert - ESCA Forced Deactivation   | 16-3  |
| X'0000'             | 87                 | Usage Tier Exceeded Generic Alert  | 16-3  |
| X'0000'             | 60                 | Alert Threshold for Dynamic Control Blocks Reached   | 16-3  |
| X'0000'             | 61                 | Buffers for Dynamic Control Blocks Depleted  | 16-4  |
| X'0000'             | 62                 | Allocation for Dynamic Control Blocks failed: Too Close to Slow-down                                       | 16-4  |
| X'0000'             | 63                 | First Dynamic Control Block Allocated  | 16-4  |
| X'0000'             | 64                 | Allocation for Control Blocks Failed due to Genned Limit   | 16-4  |
| X'0001'             | 5                  | LK-EVENT Reply due to a Line Permanent Error on a Non-<br>Tailed Line                                      | 16-4  |
| X'0001'             | 6                  | LK-EVENT Reply due to a Line Permanent Error on a Tailed Line  | 16-4  |
| X'0001'             | 7                  | LK-EVENT Reply due to a Station Permanent Error on a Non-<br>Tailed SDLC Line                              | 16-4  |
| X'0001'             | 8                  | LK-EVENT Reply due to a Station Permanent Error on a Tailed SDLC Line                                      | 16-4  |
| X'0001'             | 9                  | LK-EVENT Reply due to a BSC Terminal Permanent Error on a Non-Tailed BSC Line                              | 16-5  |
| X'0001'             | 10                 | LK-EVENT Reply due to a BSC Terminal Permanent Error on a Tailed BSC Line                                  | 16-5  |
| X'0001'             | 68                 | LK-EVENT Generated for Frame-relay (Logical Line)  | 16-5  |
| X'0001'             | 11                 | Format for a LK-EVENT Generated by NTRI (Logical Link)   | 16-5  |
| X'0001'             | 80                 | LK-EVENT for ODLC Station/Link Error   | 16-5  |
| X'0010'             | 12                 | Error Reply to Modify Session Information Retrieval Data Request or to a Query Data Request                | 16-7  |
| X'0010'             | 13                 | Common Data and Control Block Data for a Session Information<br>Retrieval Query Data Reply for SNI Session | 16-7  |

|                     |                    | NMVT Subvector List   | 16-104 |

NCP NMVT PIU records are identified by RU bytes 1 and 2. "NMVT RU Header Format" on page 16-5 is common to all NMVT requests, responses, and replies. RU byte 1=X'03' and RU byte 2=X'8D'. Bytes 3 and 4 are reserved; bytes 5 and 6 contain the procedure related identifier (PRID) information; byte 7 contains NMVT chaining bits and other information. Byte 8 is the beginning of the NMVT record and is the first of a 2-byte major vector length field. Bytes 10 and 11 contain the major vector key, which distinguishes between the types of NMVT records.

All subvectors and subfields begin with 1-byte length and key fields. The subvectors occur in any order, but it is important to understand that a major vector and its set of subvectors uniquely identifies an NMVT. Therefore, if you have a major vector key, go to that vector's section in the following pages and map your group of subvectors (appearing in your NMVT) to the NMVT formats. You will find one NMVT that matches your combination of major vectors and subvectors. Once inside the subvectors, it is essential that you pay close attention to the subfield length and key values because the subfields may appear in any order and some may not be present in all subvectors. The RU formats for the subvectors with their associated subfields follow the RU formats for the NMVT requests and replies.

### **NMVT RU Header Format**

Common to all NMVT requests, responses, and replies

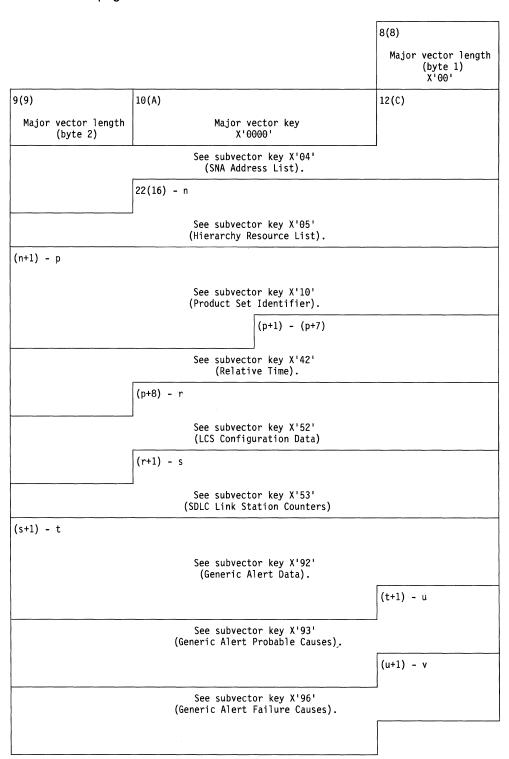

<sup>\*</sup> Indicates a byte expansion follows.

#### **Byte Expansions**

| Offset/Field<br>Name | Bit Pattern/<br>Hex Value | Contents  |
|----------------------|---------------------------|---|
| 7(7)<br>MSUFLAGS     |                           | Sequence and control flags for NMVT   |
|                      | x                         | 1 = Solicited data  |
|                      |                           | 0 = Unsolicited data  |
|                      | .10                       | First NMVT of a group   |
|                      | .11                       | Middle NMVT of a group  |
|                      | .01                       | Last NMVT of a group  |
|                      | .00                       | Only NMVT   |
|                      | x                         | 1 = SNA address list (SAL) translation required. The SAL must be present<br>and is the first subvector in the NMVT                    |
|                      |                           | 0 = SNA address list translation not required. The SAL may or may not be<br>present. It may or may not be first subvector in the NMVT |
|                      | xxx.                      | Reserved  |
|                      | 1                         | LPDA2 test for secondary circuit of a DMPX non-port A line (unsolicited) (MSUSEC)   |

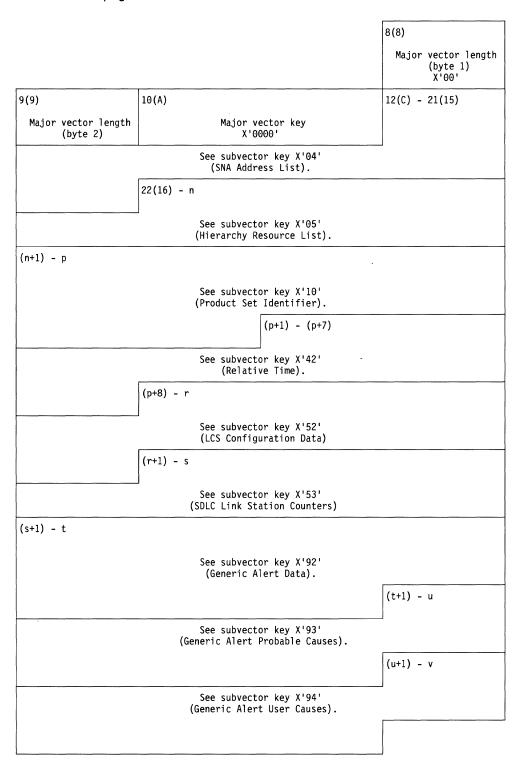

### Alert Due to a Logical Frame Relay Line Failure Caused by a Physical Frame Relay Line Failure

Note: 47 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

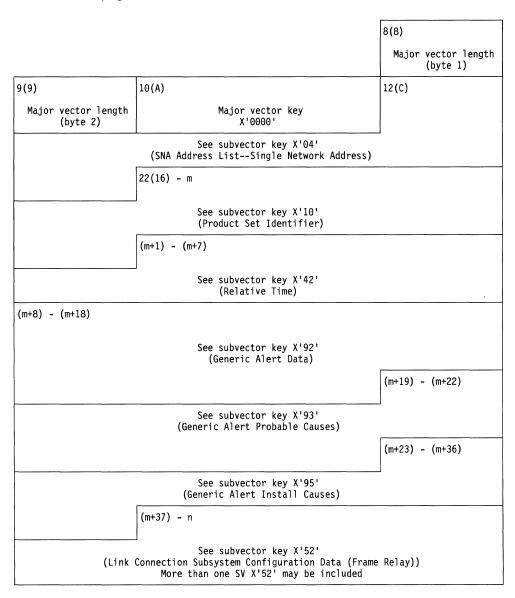

### Alert Due to a Logical Frame Relay Line Failure Caused by Forced Deactivation of a Physical Frame Relay Line

**Note: 48** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

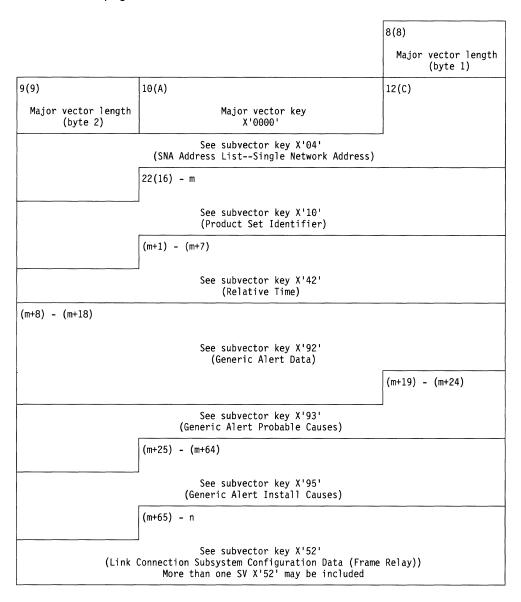

### Alert Due to Frame Relay DLCI Mismatch between Adjacent Frame **Relay Nodes**

Note: 52 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

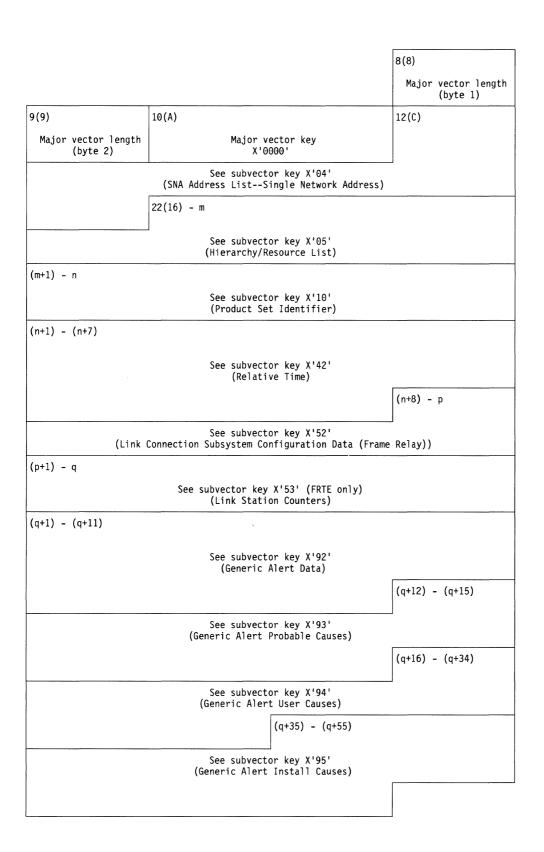

### Alert Due to LMI Configuration Mismatch between Adjacent Frame Relay Nodes

**Note:** 53 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

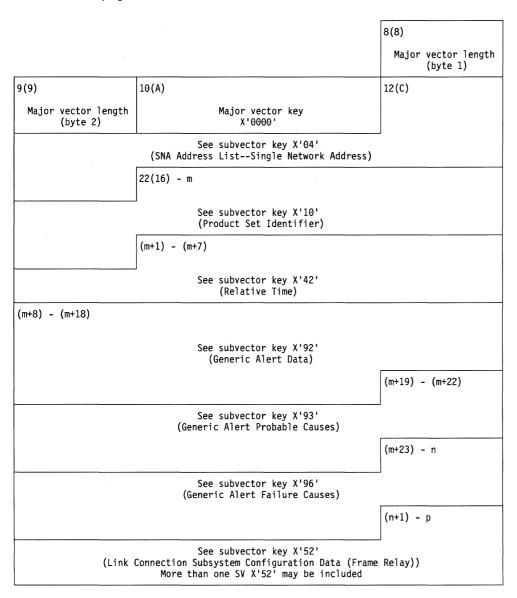

### Alert due to Frame Relay Subport Failure Caused by a Deleted DLCI

Note: 54 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

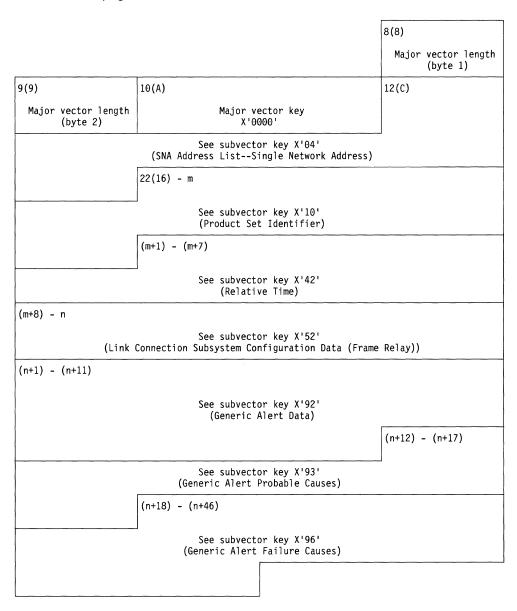

### Alert due to Frame Relay Subport(s) Failure Caused by Inactive DLCI

Note: 55 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

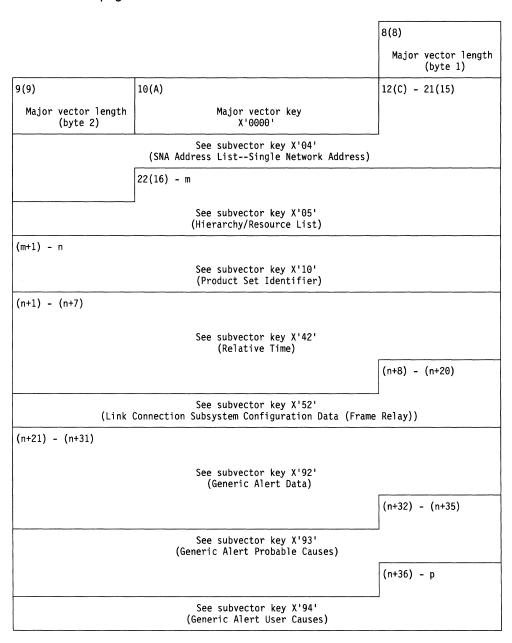

### Alert due to LMI Error Threshold Reached on Frame Relay Physical Line

**Note: 56** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

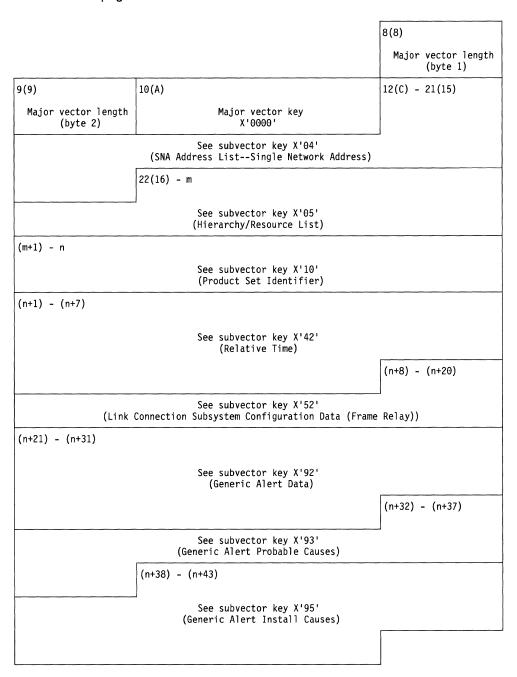

### Alert Due to Frame Relay FRSE Subport Failure Caused by the Deletion of its FRSE Subport Partner

**Note:** 57 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### Alert Due to FRSE Substitute Subport Failure Caused by LMI Configuration Mismatch

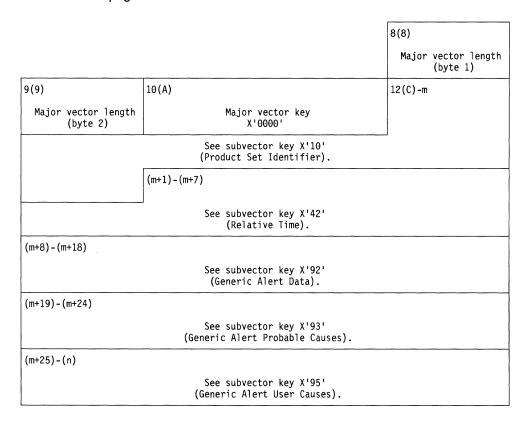

**Note: 58** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### Frame-Relay Microcode Mismatch Alert

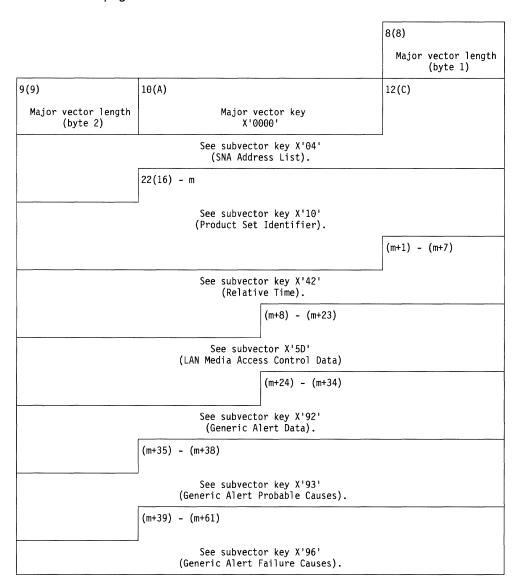

This alert is sent when a Frame Relay physical line which was coded as FRELAY=(PHYSICAL,ANY) does not have the microcode level to supports peripheral and subarea nodes on the same scanner.

**Note:** 91 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### NCP ETSS CSMA/CD LAN No-Carrier Generic Alert

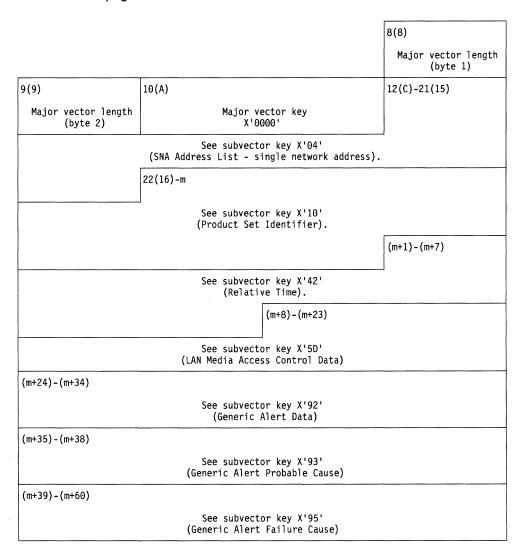

Note: 49 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### **Down-Level ESS Adapter Microcode Alert**

During activation of an ESS adapter, NCP learned that the ESS ADAPTER microcode cannot process the Ethernet frames supported table.

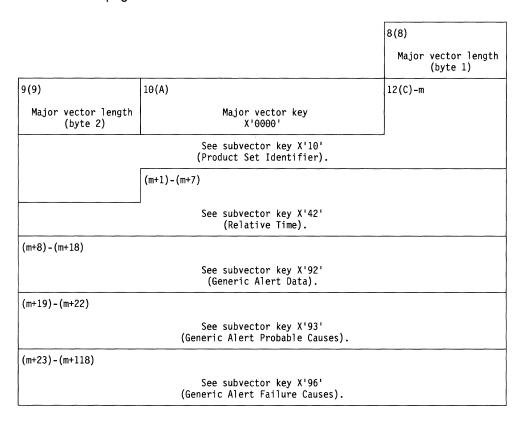

**Note: 65** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### **Owning TCP/IP Host Down Alert**

This it the case where NCP believes the owning TCP/IP host's NCPROUTE application is down, since a datagram has not been received by NCP from the owning TCP/IP's NCPROUTE application in the previous three minutes.

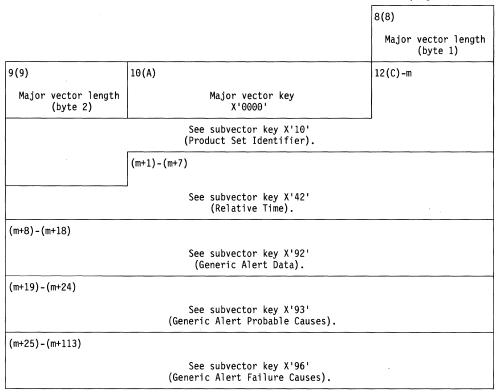

**Note:** 66 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### **Bad NCPROUTE Datagram Alert**

This is the case where the NCP has received a bad datagram from NCPROUTE and puts the IP Router in a "reset" state.

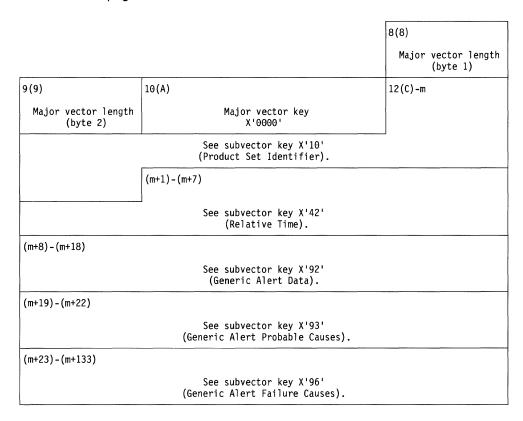

Note: 67 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **Hello Threshold Reached Alert**

NCP has sent a number of "Hello" UDP datagrams to the owning TCP/IP host's NCPROUTE application. Each time NCP sent one of these datagrams, NCP timed out waiting for an acknowledgement. The number of consecutive timeouts has reached a user-specifiable threshold.

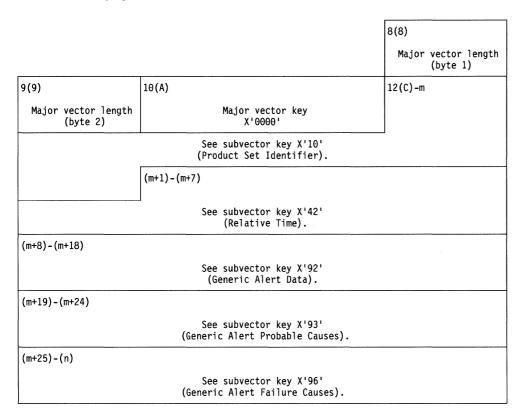

**Note: 88** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### **NCPROUTE Connection Activation Failed Alert**

This is the case where NCP has received a UDP datagram from the owning TCP/IP host's NCPROUTE application indicating that activation of the NCP-IP-Router-to-NCPROUTE connection failed; and, therefore, NCP has put the router in a "reset" state.

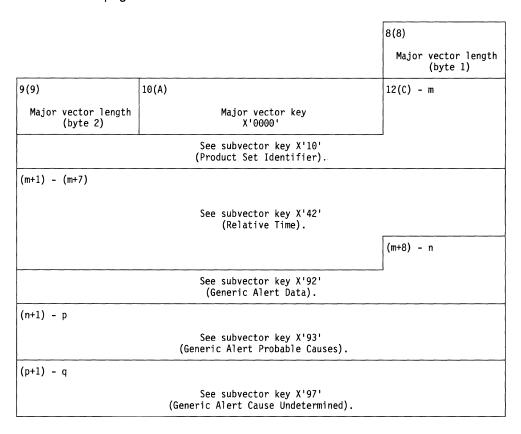

Note: 89 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### Alert Due to a Blocked Virtual Route

- · VR held time limit reached.
- VR pacing withheld time limit reached.
- Held VR deactivation time limit reached.
- VR transmit queue overrun.

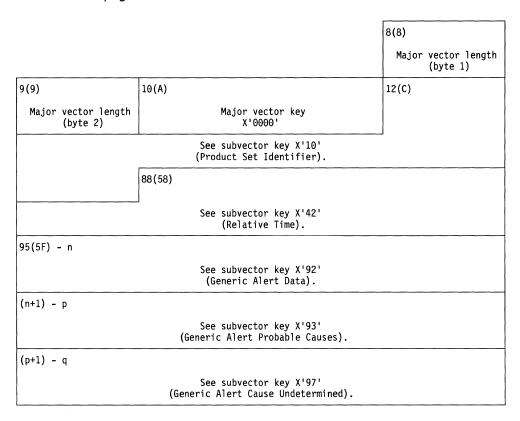

**Note:** 51 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### Alert Due to a Virtual Route Out-of-Sequence

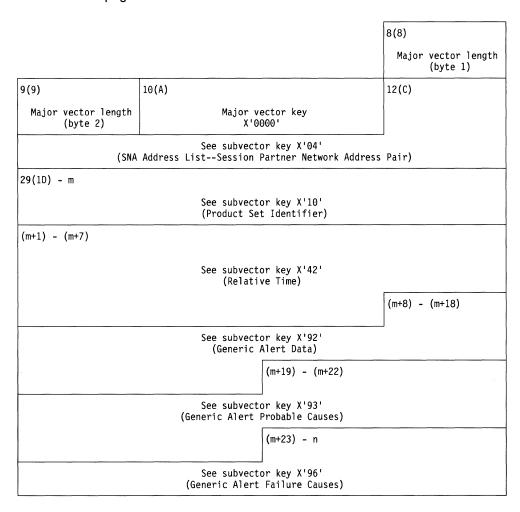

This alert is sent, when NCP first detects a virtual route is out of sequence.

**Note:** 72 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

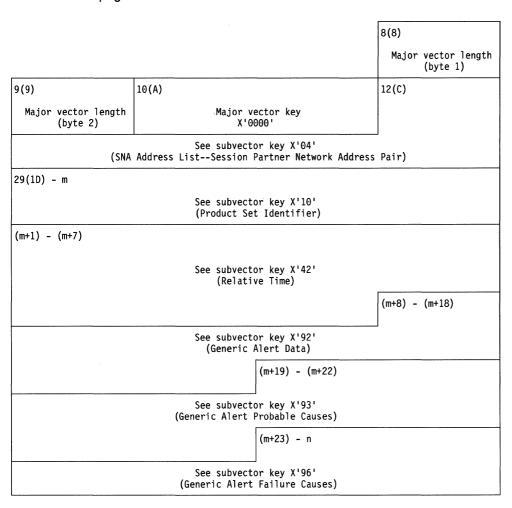

### Alert due to NCST Receiving a PIU which Violates a SNA Protocol

**Note: 70** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### Alert due to NCST Logic Error

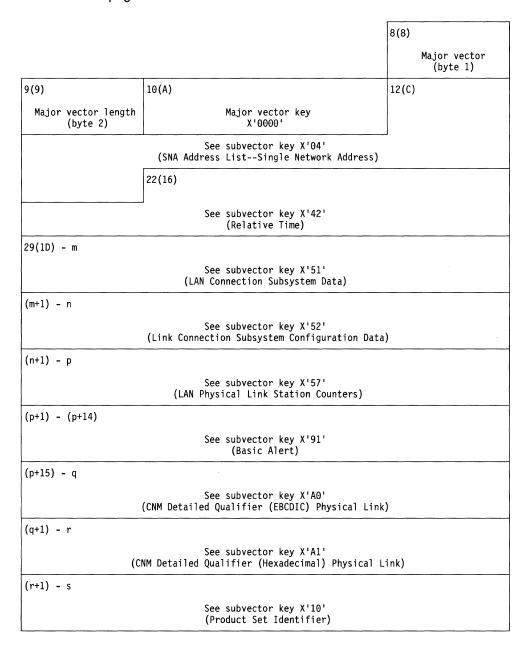

Note: 71 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### Alert Generated by NTRI (Physical Link)

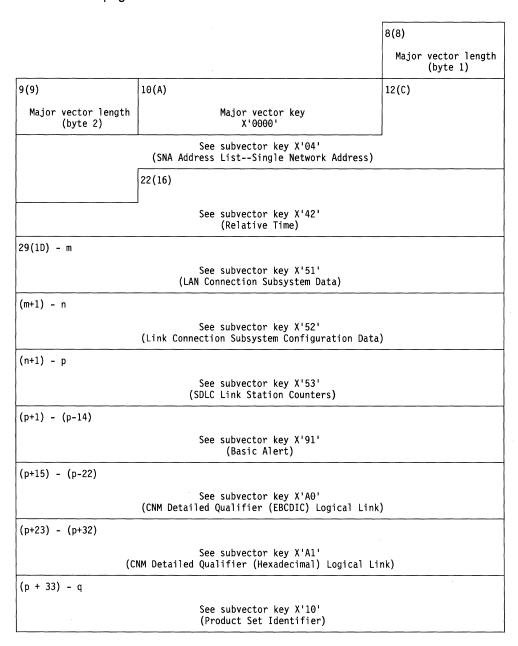

If the action code (see subvector key X'91') is X'13', or X'1F', subvector key X'57' is not included.

Note: 1 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

## Alert Generated by NTRI (Logical Link)

Note: 3 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

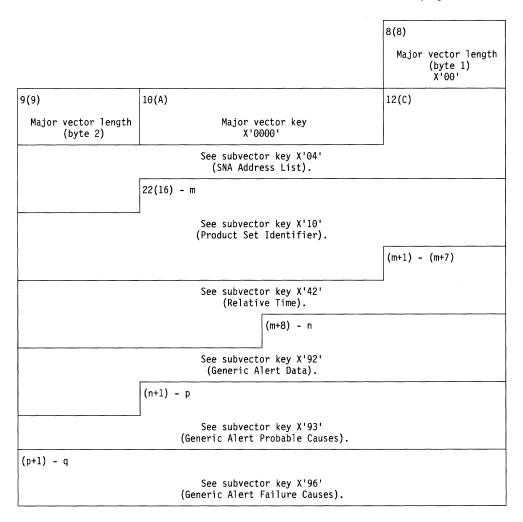

### Alert Due to a Modem Dial-Out Failure (NCP Case), SNA Protocol Error, NCST Logic Error, Invalid Dial Digits, or Callout Contention

Note: NMVTs with the following cross reference numbers from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. use this format:

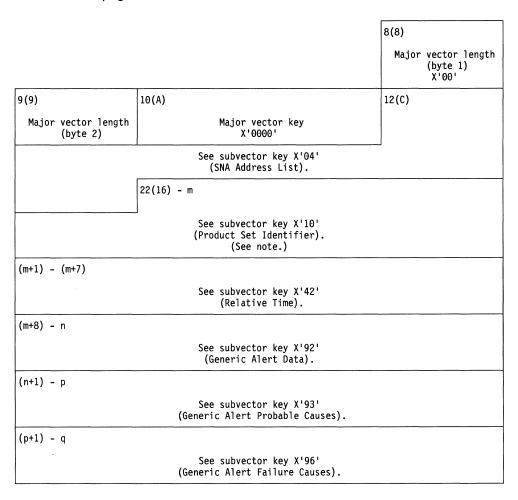

- 4a.
- 70.
- 71.
- 92.
- 93.

A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# Alert Due to a Modem Dial-Out Failure (NEO Case)

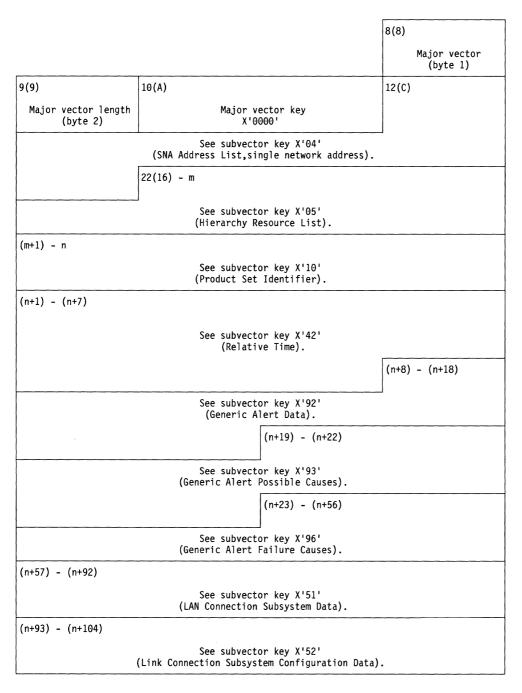

Note: 4b is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

Note: If the network enhancement option (NEO) chooses to display its NEO product identifier subvector X'11', it will appear within the Product Set Identifier (PSI) subvector X'10' of the generic alert. Otherwise, the layout for the NEO generic alert NMVT will be the same as the layout for the NCP case.

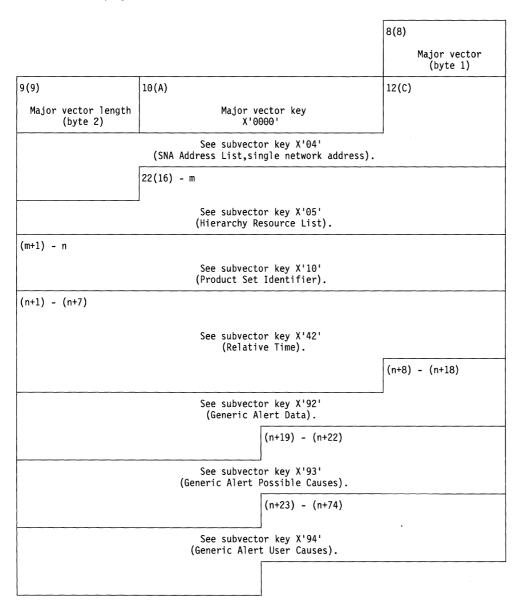

# ODLC Token-Ring Logical Resource Failure Caused by Failure of the Physical Link

**Note: 73** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

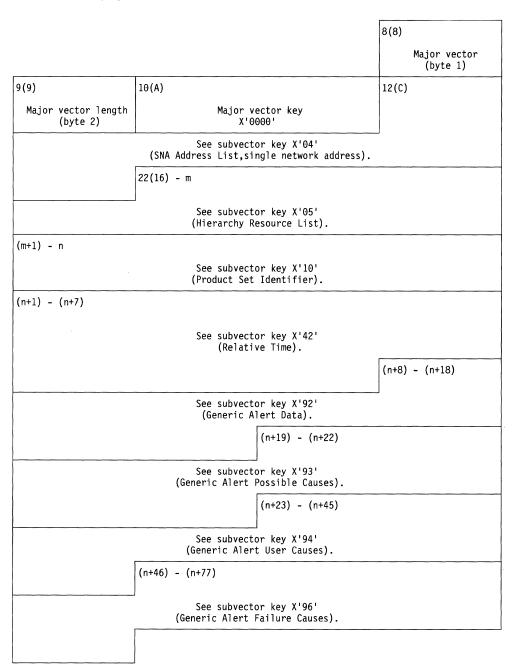

### **ODLC Token-Ring CONNOUT Failure - Invalid Dial Digits**

Note: 74 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

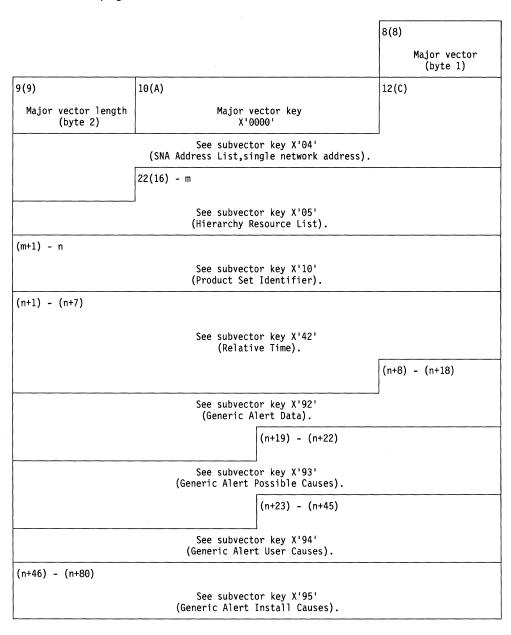

## **ODLC Token-Ring CONNOUT Failure - Physical Resource Not Operational**

Note: 75 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

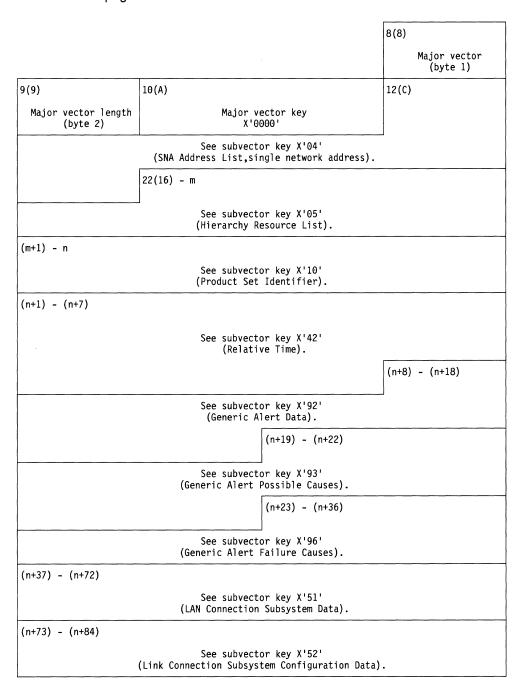

# ODLC Token-Ring Notify Call Indication LDPSA Rejection Due to No Logical Resources Available

**Note: 76** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

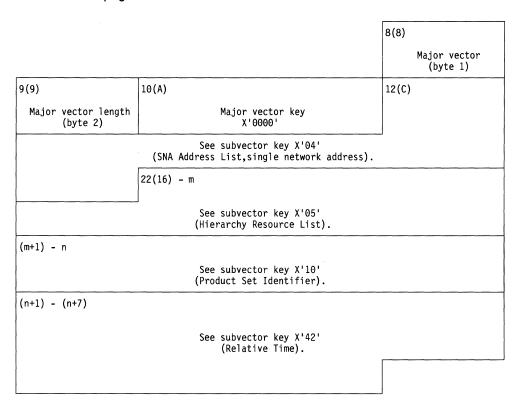

## **ODLC Token-Ring CONNOUT Failure - Incoming Call Collision**

**Note:** 77 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **ODLC Permanent Station/Link Error Alert**

Note: 78 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

When subvectors are supplied by the CSS:

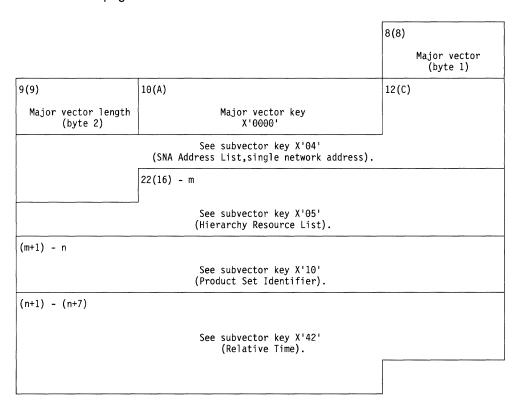

```
(n+8) - m
                               Subvectors supplied by the CSS
                     (one or more subvectors in MS architected format).
```

When no subvectors are provided by the CSS the following are built by the NCP:

```
(n+8) - (n+51)
                                   See subvector key X'47'.
                                      (MSU Correlation)
(n+52) - (n+62)
                                   See subvector key X'92'
                                    (Generic Alert Data).
(n+63) - (n+66)
                                   See subvector kev X'93'
                               (Generic Alert Possible Causes).
(n+67) - m
                                   See subvector key X'96'
                               (Generic Alert Failure Causes).
```

#### ODLC Permanent Link Error Alert - ESCA Forced Deactivation

**Note: 79** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

When subvectors are supplied by the CSS:

When no subvectors are provided by the CSS the following are built by the NCP:

```
(n+8) - (n+51)

See subvector key X'47'.

(MSU Correlation)

(n+52) - (n+62)

See subvector key X'92'

(Generic Alert Data).

(n+63) - (n+66)

See subvector key X'93'

(Generic Alert Possible Causes).

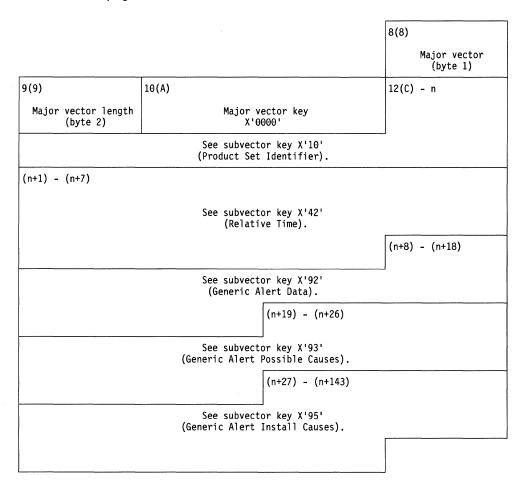

(n+67) - (n+91)

See subvector key X'94'

(Generic Alert User Causes).
```

#### **Usage Tier Exceeded Generic Alert**

**Note:** 87 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

### **Alert Threshold for Dynamic Control Blocks Reached**

This is the case where the Control Block Buffer Usage Alert Threshold (DYNPOOL(2nd suboperand)) has been reached.

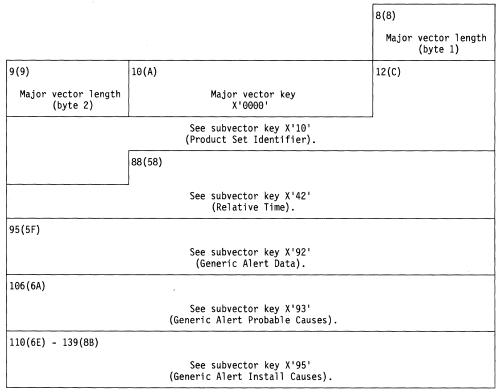

Note: 60 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

|                                 |   | . •                             |
|---------------------------------|---|---------------------------------|
|                                 |   | 8(8)                            |

#### **Buffers for Dynamic Control Blocks Depleted**

This is the case where the maximum allowable amount of the buffer pool (DYNPOOL(1st suboperand)) is already being used for control blocks and a request is received for which another control block needs to be dynamically allocated.

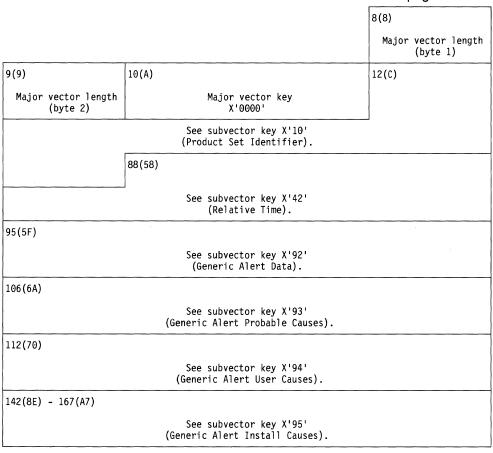

**Note: 61** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### Allocation for Dynamic CBs failed: Too Close to Slowdown

Even if the Control Block Buffer Usage Threshold (DYNPOOL (2nd suboperand)) has not been reached, dynamic allocation of a control block can fail due to NCP being too close to going into slowdown.

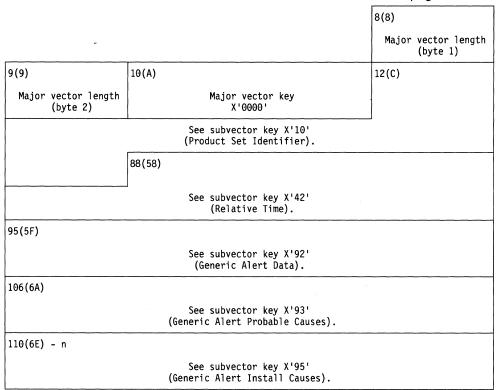

**Note: 62** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **First Dynamic Control Block Allocated**

This alert will be sent the very first time a control block of a particular type is built dynamically.

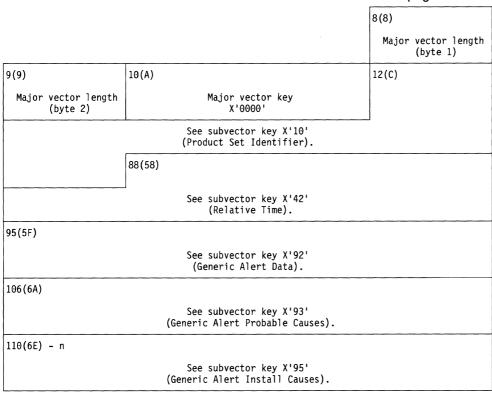

Note: 63 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### Allocation for Control Block Failed due to Genned Limit

This alert is send the very first time allocation fails for a particular type of control block due to a genned limit.

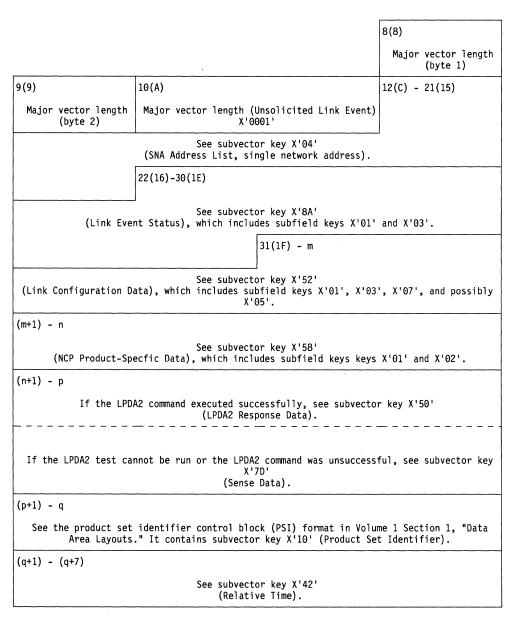

Note: 64 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### LK-EVENT Reply Due to a Line Permanent Error on a Non-Tailed Line

- · An unsolicited reply.
- The LPDA2 NMVT builder (CXDTLPD), the subvector 52 builder (CXDTS52), and the NMVT reply generator (CXDTREP) build this NMVT.

**Note: 5** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# LK-EVENT Reply Due to a Line Permanent Error on a Tailed Line

- An unsolicited reply.
- The LPDA2 NMVT builder (CXDTLPD), the subvector 52 builder (CXDTS52), and the NMVT reply generator (CXDTREP) build this NMVT.

Note: 6 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

| Major vector (byte 9(9)  Major vector length (byte 2)  See subvector key X'04' (SNA Address List, single network address).  22(16) - 30(1E)  See subvector key X'8A' (Link Event Status), which includes subfield keys X'01' and X'03'.  31(1F) - m  (Link Configuration Data) which includes subfield keys X'01', X'03', X'07', and X'05'. # Common Management Information Protocol (CMIP) Link Data

Note: 83 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

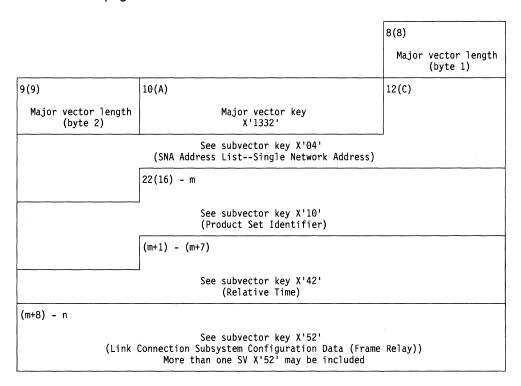

#### Common Management Information Protocol (CMIP) Station Data

**Note: 84** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **Link Configuration Data**

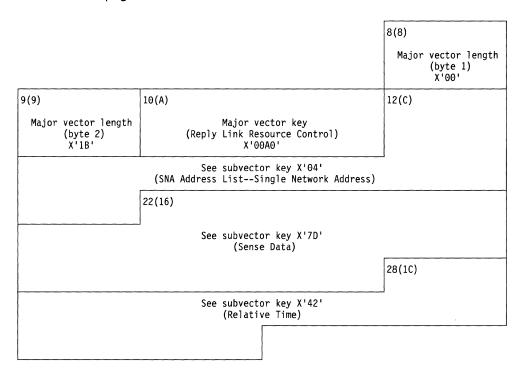

Note: 59 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# Error Reply to a Set or Query Link Attributes Request or an Alter or Query Link Station Attributes Request

- · A reply to an NMVT request.
- The set link attributes processor (CXDTSLA) or the query line adapter processor (CXDTQLA) or the alter link station attributes (LSA) processor (CXDTDTAP) or the query LSA processor (CXDTDTQP) and the NMVT reply generator (CXDTREP) build this NMVT.

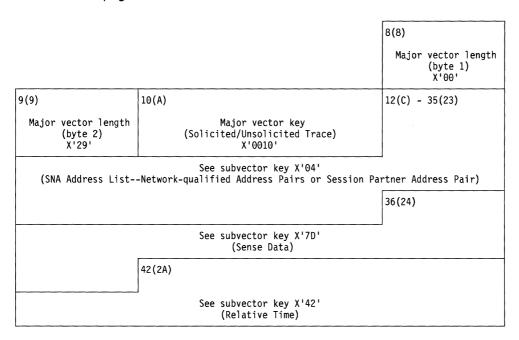

**Note: 36** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### Error Reply to a Modify SIR Data Request or to a Query Data Request

- A reply to an NMVT request.
- The session information retrieval (SIR) modify processor (CXDTGTM or CXDTGTM2) or the SIR query processor (CXDTGTQ or CXDTGTQ2) and the NMVT error reply generator (CXDTNRPL) build this NMVT.

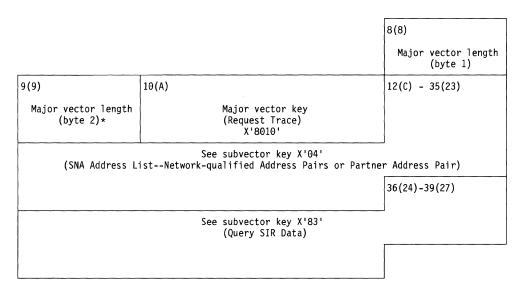

Note: 12 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **SIR Data Request**

- An NMVT request.
- · NetView builds and sends this NMVT.

**Note: 37** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

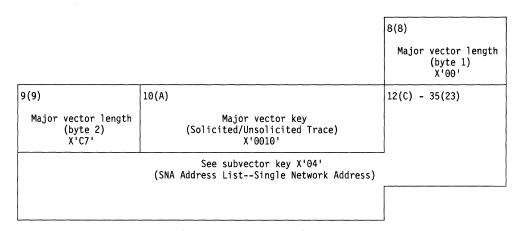

<sup>\*</sup> The major vector length is X'0020' for an NMVT containing one network qualified address pair (target address) in the SNA Address List subvector. This length increases by 20 for each additional target address. Also, see the note with "Subvector Key X'04' (SNA Address List)" on page 16-109.

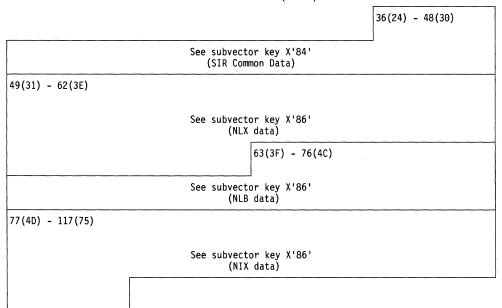

# Common Data and Control Block Data for a SIR Query Data Reply for SNI Session

- · An unsolicited reply or a reply to an SIR Query Data NMVT request.
- The session information retrieval (SIR) query processor (CXDTGTQ) and the NMVT reply generator (CXTREP) build this NMVT.

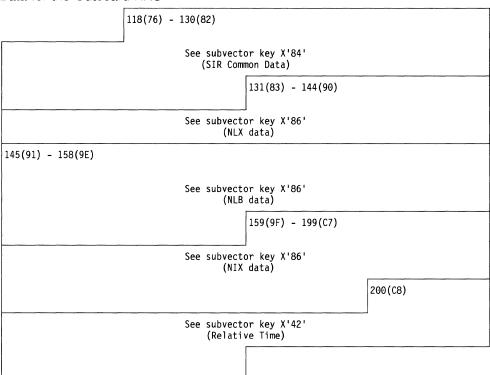

**Note:** 13 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

Data for the Native Network Addressable Unit (NAU)

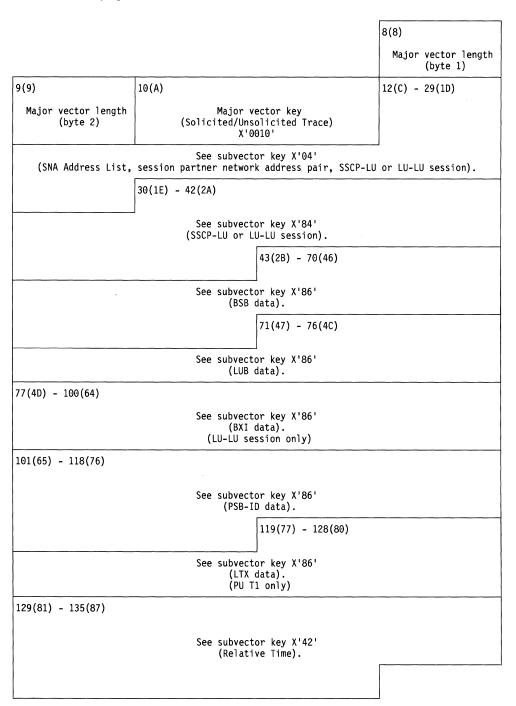

#### Data for the Outboard NAU

#### Common Data and Control Block Data for a SIR Query Data Reply for SSCP-LU or LU-LU Session

The session information retrieval (SIR) query processor (CXDTGTQ2) and the NMVT reply generator (CXDTREP) build this NMVT.

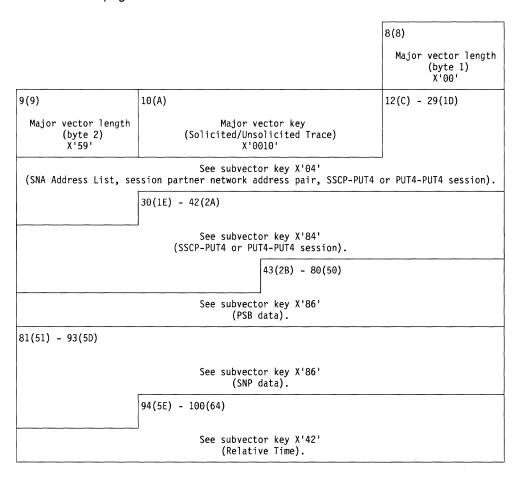

Note: 14 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# Common Data and Control Block Data for a SIR Query Data Reply for SSCP-PUT4 or PUT4-PUT4 Session

The session information retrieval (SIR) query processor (CXDTGTQ2) and the NMVT reply generator (CXDTREP) build this NMVT.

**Note:** 15 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# Common Data and Control Block Data for a SIR Query Data Reply for **SSCP-PUT2 Session (Duplex Case)**

The session information retrieval (SIR) query processor (CXDTGTQ2) and the NMVT reply generator (CXDTREP) build this NMVT.

Note: 16 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **Query Flow Control Request**

• An NMVT request

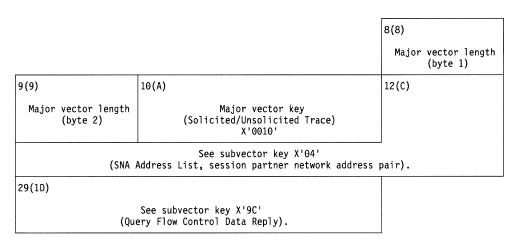

Note: 86 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **Query Flow Control Reply**

- · A reply to a Query Flow Control Request
- The Request Flow Control Data Processor (CXDTRFCP) and the NMVT Reply Generator (CXDTREP) build this NMVT.

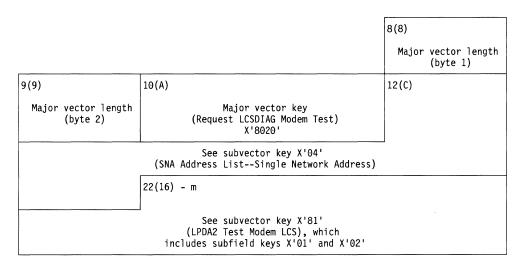

Note: 81 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **LCSDIAG Modem Request**

- An NMVT request.
- Network Problem Determination Aid (NPDA) builds and sends this NMVT.

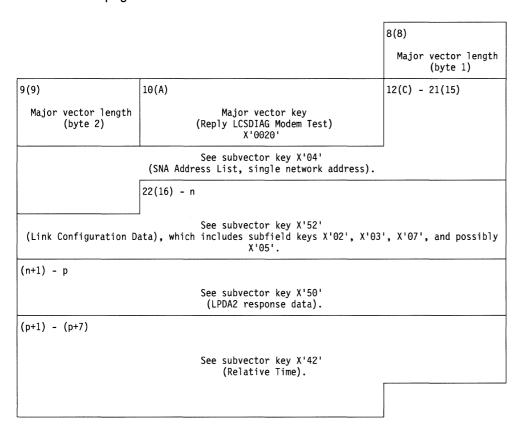

**Note:** 40 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **LCSDIAG Modem Positive Reply**

- A positive reply to an LCSDIAG NMVT request.
- The LPDA2 pre-initiator (CXDKSYP), the LPDA2 terminator (CXDKSYT), and the NMVT reply generator (CXDTREP) build this NMVT.

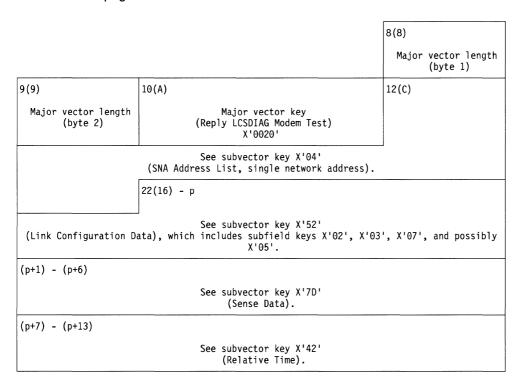

Note: 21 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **LCSDIAG Modem Negative Reply**

- A negative reply to a LCSDIAG NMVT request.
- · Caused by nonsyntactical errors.
- The LPDA2 pre-initiator (CXDKSYP), the LPDA2 terminator (CXDKSYT), and the NMVT reply generator (CXDTREP) build this NMVT.

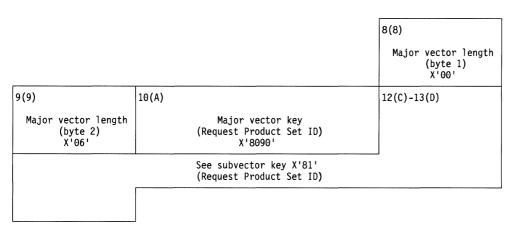

**Note: 22** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **Product Set ID Request**

- An NMVT request.
- · NetView builds and sends this NMVT.

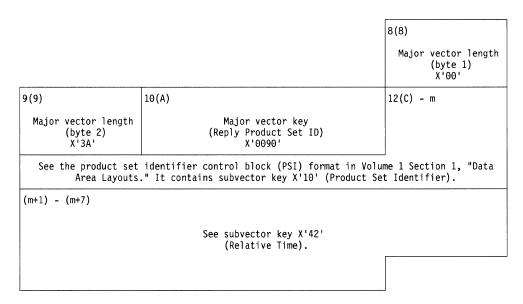

Note: 41 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **Product Set ID Reply**

- · A reply to a Product Set ID NMVT request.
- This query product set ID processor (CXDTQPI) and the NMVT reply generator (CXDTREP) build this NMVT.

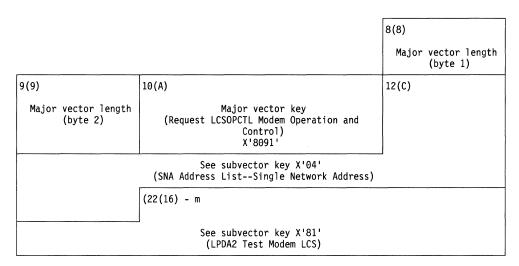

**Note:** 29 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **LCSOPCTL Modem Request**

- An NMVT request.
- NetView builds and sends this NMVT.

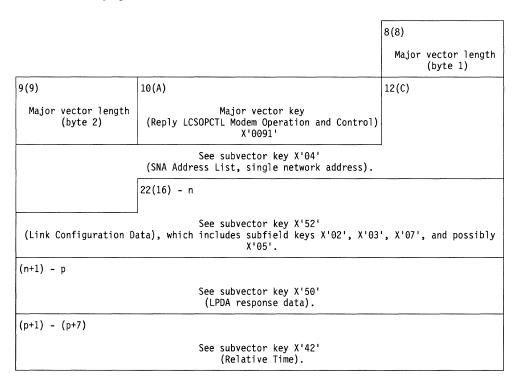

Note: 42 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **LCSOPCTL Modem Positive Reply**

- A positive reply to a LCSOPCTL NMVT request.
- The LPDA2 pre-initiator (CXDKSYP), the LPDA2 terminator (CXDKSYT), and the NMVT reply generator (CXDTREP) build this NMVT.

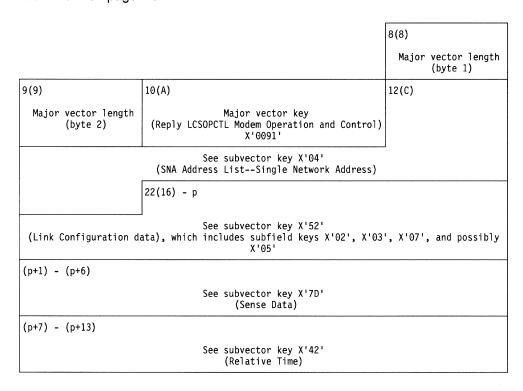

Note: 30 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **LCSOPCTL Modem Negative Reply**

- A negative reply to a LCSOPCTL NMVT request.
- The LPDA2 pre-initiator (CXDKSYP), the LPDA2 terminator (CXDKSYT), and the NMVT reply generator (CXDTREP) build this NMVT.

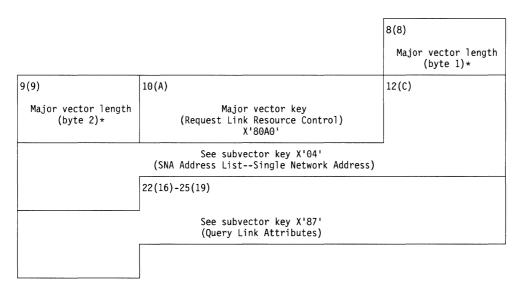

**Note:** 31 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

#### **Query Link Attributes Request**

- An NMVT request.
- · NetView builds and sends this NMVT.

Note: 43 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

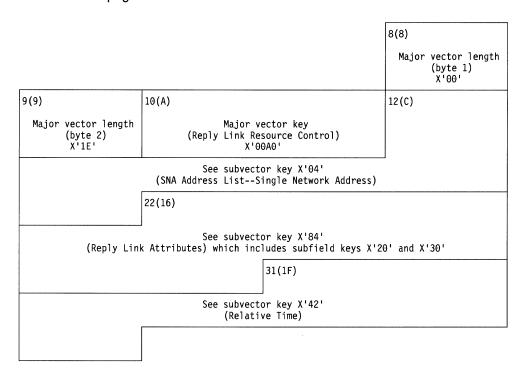

<sup>\*</sup> The major vector length is X'0012' for an NMVT containing one single network address (target address) in the SNA Address List subvector. The length increases by 6 for each additional target address. Also, see "Subvector Key X'04' (SNA Address List)" on page 16-109.

# **Query Link Attributes Reply**

- A reply to a Query Link Attributes NMVT request.
- The query link attributes processor (CXDTQLA) and the NMVT reply generator (CXDTREP) build this NMVT.

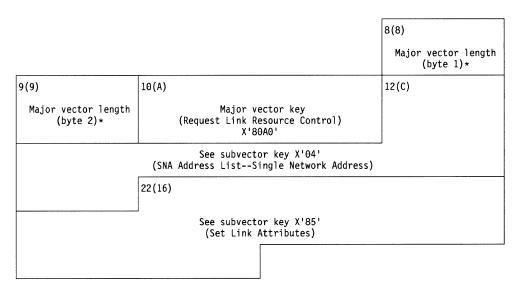

**Note: 32** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

# **Set Link Attributes Request**

- An NMVT request.
- NetView builds and sends this NMVT.

**Note:** 44 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

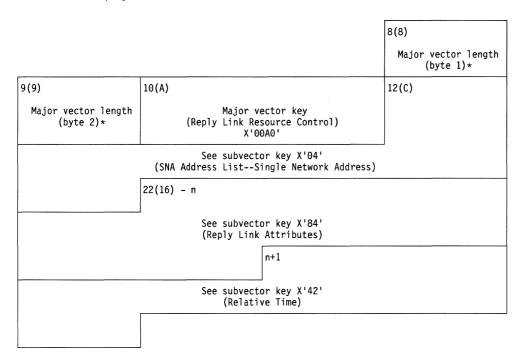

<sup>\*</sup> The major vector length is X'0013' for an NMVT containing one single network address (target address) in the SNA Address List subvector. This length increases by 6 for each additional target address. Also, refer to the note with "Subvector Key X'04' (SNA Address List)" on page 16-109.

# **Set Link Attributes Reply**

- A reply to a Set Link Attributes NMVT request.
- The set link attributes processor (CXDTSLA) and the NMVT reply generator (CXDTREP) build this NMVT.

**Note:** 33 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

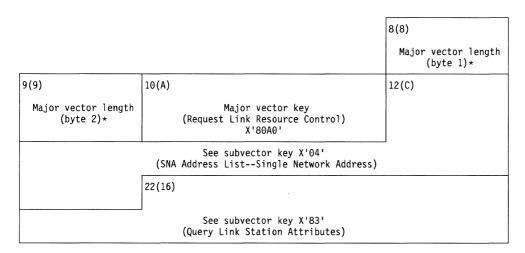

<sup>\*</sup> The major vector length is equal to the sum of the subvector lengths plus 4.

# **Query Link Station Attributes Request**

- An NMVT request.
- · NetView builds and sends this NMVT.

Note: 45 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

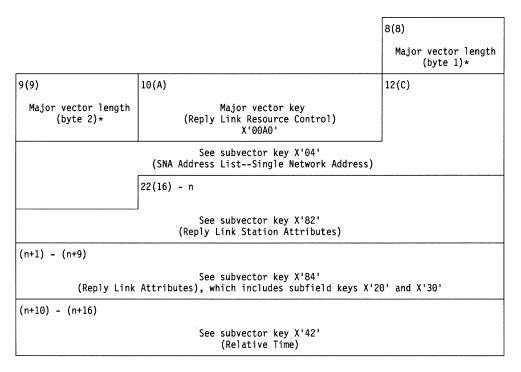

<sup>\*</sup> The major vector length is X'0012' for an NMVT containing one single network address (target address) in the SNA Address List subvector. This length increases by 6 for each additional target address. Also, see "Subvector Key X'04' (SNA Address List)" on page 16-109.

# **Query Link Station Attributes Reply**

- A reply to a Query Link Station Attributes NMVT request.
- The query link station attributes (LSA) processor (CXDTDTQP) and the NMVT reply generator (CXDTREP) build this NMVT.

Note: 34 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

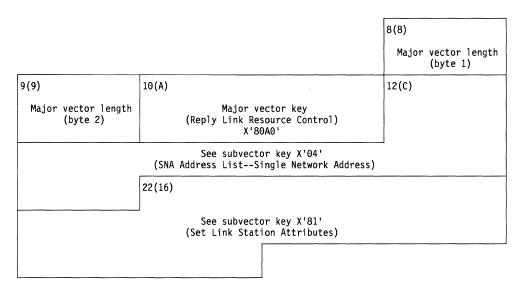

<sup>\*</sup> The major vector length is equal to the sum of the subvector lengths plus 4.

# **Alter Link Station Attributes Request**

- An NMVT request.
- NetView builds and sends this NMVT.

**Note:** 46 is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List" on page 16-104. A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

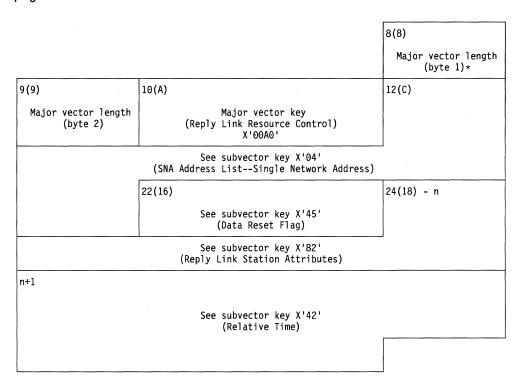

<sup>\*</sup> The major vector length is X'0013' for an NMVT containing one single network address (target address) in the SNA Address List subvector. This length increases by 6 for each additional target address. Also, see "Subvector Key X'04' (SNA Address List)" on page 16-109.

# **Alter Link Station Attributes Reply**

- · A reply to an Alter Link Station Attributes NMVT request.
- The alter link station attributes (LSA) processor (CXDTDTAP) and the NMVT reply generator (CXDTREP) build this NMVT.

**Note: 35** is the cross reference number of this request or reply from the "Network Management Vector Transport (NMVT) Subvector List." A list of all cross reference numbers can be found in Table 16-1 on page 16-1.

<sup>\*</sup> The major vector length is equal to the sum of the subvector lengths plus 4.

# **Network Management Vector Transport (NMVT) Subvector List**

The following table shows, by key value, the NMVT requests and replies that contain the specific subvector. The numbers in the third column refer to numbers assigned to NMVT requests and replies as shown in the table at the beginning of this section. Subvector formats, together with their associated subfields, follow this table.

| Subvector<br>Key | Subvector Description   | Cross Reference<br>Number   | Page          |
|------------------|---|---|---------------|
|                  | terisk (*) indicates both NCP/token-ring interconnection (NTF ate an NTRI-generated subvector format. | RI) and NCP subvector format  | t. Two aster- |
| X'03'            | SNA Hierarchy Name List   | 7, 8, 23, 24  | 16-108        |
| X'04'*           | SNA Address List—Single Network Address   | 1–3, 5–11, 13, 21–28, 30–36, 40, 42–50, 52–59, 68, 69, 73–80, 82–84 | 16-109        |
| X'04'            | SNA Address List—Network-Qualified Address Pair   | 4a, 4b, 12, 19, 37, 38  | 16-109        |

| Subvector<br>Key | Subvector Description                                      | Cross Reference<br>Number                         | Page   |
|------------------|--|---|--------|
| X'04'            | SNA Address List—Session Partner Network Address Pair      | 12, 14–19, 37, 38,<br>70, 71, 81, 86              | 16-109 |
| X'05'            | Hierarchy/Resource List                                    | 47, 48, 54, 57, 58,<br>68, 69, 73–80, 82–84       | 16-112 |
| X'0C'            | Distinguished Named Extension                              | 83, 84  | 16-113 |

# Subvector Key X'04' (SNA Address List)

#### Single Network Address

| 0(0)              | 1(1)   | 2(2)  | 3(3)                         |
|-------------------|--|---|------------------------------|
| Subvector length* | SNA address list<br>subvector key<br>X'04'   | Retired<br>(for a request)                      | Target address type<br>X'80' |
|                   |  | Target count<br>X'01' (for a reply)             |                              |
| 4(4) - 9(9)       |  |   |                              |
| (the first 4 byte | Single network ad<br>s are the subarea addre | dress of the target<br>ss, followed by a 2 byte | e element address)           |
|                   |  |   |                              |
|                   |  |   |                              |

<sup>\*</sup> The SNA address list subvector length is X'0A' for an NMVT containing one single network address (target address) in the SNA address list subvector. This length and the offsets to the other subvectors increase by 6 for each additional target address.

#### Network-Qualified Address Pairs

<sup>\*\*</sup> The SNA address list subvector length is X'18' for an NMVT containing one single network address pair (target address) in the SNA address list subvector. This length and the offsets of the other subvectors increase by 20 for each additional target address.

#### Session Partner Network Address Pair

- SSCP-LU or LU-LU session
- SSCP-PUT4 or PUT4-PUT4 session
- SSCP-PUT2 session.

#### SSCP-LU or LU-LU Session

| 0(0)                      | 1(1)                                       | 2(2)   | 3(3)                                  |
|---------------------------|--|--|---------------------------------------|

#### Subfield Key X'04' (Remote Individual MAC Address)

| 0(0)                          | 1(1)                  | 2(2) - 7(7) |
|-------------------------------|-----------------------|-------------|
| Subfield length<br>X'08'      | Subfield key<br>X'04' |             |
| Target individual MAC address |                       |             |

#### Subfield Key X'05' (MAC Routing Information)

| 0(0)            | 1(1)                  | 2(2) - q                |
|-----------------|-----------------------|-------------------------|
| Subfield length | Subfield key<br>X'05' | MAC routing information |

#### Subfield Key X'06' (Fault Domain Description)

# Subvector Key X'52' (Link Configuration Data)

| 0(0)              | 1(1)  |
|-------------------|---|
| Subvector length* | Link Configuration<br>Data subvector key<br>X'52' |

<sup>\*</sup> The subvector length is equal to the sum of the subfield lengths plus 2. One or more subfields will be present in any order.

#### Subfield Key X'01' (Port Address)

| 0(0)                     | 1(1)                  | 2(2)                      |
|--------------------------|-----------------------|---------------------------|
| Subfield length<br>X'04' | Subfield key<br>X'01' | Port address (AXBOLDLN)** |

<sup>\*\*</sup> Indicates the control block field from which this NMVT field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

#### Subfield Key X'02' (Remote Device Address)

| 0(0)            | 1(1)         | 2(2)                  |
|-----------------|--------------|-----------------------|
| Subfield length | Subfield key | Remote device address |
| X'03'           | X'02'        | (See note)            |

Note: The remote device address is loaded from one of the following:

- SDLC line (SCBADRC)
- BSC line:
  - (DAEADDR) if address characters
  - (DVBPOLL) if polling characters
  - X'FF' if neither addressing nor polling characters

#### Subfield Key X'03' (Modem LCS Topology)

| 0(0) |                        | 1(1)                  | 2(2)  | 3(3)  |
|------|------------------------|-----------------------|---|---|
| Sul  | ofield length<br>X'04' | Subfield key<br>X'03' | Modem configuration<br>type X'00'<br>(See note) | Link segment on which<br>the resource resides |

**Note:** Modem configuration type:

1... Channelized modem is in use.1... Integrated modem is in use.

#### Subfield Key X'05' (Modem LCS Correlation Number)

| 0(0)            | 1(1)         | 2(2)               |
|-----------------|--------------|--------------------|
| Subfield length | Subfield key | Correlation number |
| X'04'           | X'05'        | (LKBCORN)*         |

<sup>\*</sup> Indicates the control block field from which this NMVT field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

#### Subfield Key X'06' (Modem LCS Link Station Attributes)

| 0(0)                     | 1(1)                  | 2(2)   | 3(3)                              |

# Subvector Key X'52' (Link Connection Subsystem Configuration Data) FR

| 0(0)              | 1(1)                |  |
|-------------------|---------------------|--|
| Subvector length* | Subvector key X'52' |  |

<sup>\*</sup> The subvector length is equal to the sum of the subfield lengths plus two. One or more subfields will be present in any order.

#### Subfield Key X'04' (Local Device Address)

| 0(0)                  | 1(1)               | 2(2) |
|-----------------------|--------------------|------|
| Subfield length X'04' | Subfield key X'04' | DLCI |

#### Subfield Key X'07' (LCS Link Attributes)

| 0(0)                                 | 1(1)                                | 2(2)                                | 3(3)                           |
|--------------------------------------|-------------------------------------|-------------------------------------|--------------------------------|
| Subfield length X'07'                | Subfield key X'07'                  | Link connection type<br>used X'03'* | Half- or full-duplex<br>X'02'* |
| 4(4)                                 | 5(5)                                | 6(6)                                |                                |
| DLC protocol type<br>X'00' or X'07'* | Point-to-point or multipoint X'01'* | MAC type X'01' Frame<br>relay       |                                |

<sup>\*</sup> See notes.

Note: Link connection type used:

- X'01' nonswitched
- X'02' switched
- X'03' packet switched

Note: Half- or full-duplex:

- X'01' half-duplex
- X'02' full-duplex

**Note:** DLC protocol type:

- X'00' Unknown
- X'01' SDLC
- X'02' BSC
- X'03' Start-stop
- X'04' LAPB
- X'05' LAPD
- X'06' LAPE
- X'07' LAN LLC

Note: Point-to-point or multi-point:

- X'01' point-to-point
- X'02' multi-point

| Subvector length<br>X'05'    | Modify SIR control<br>subvector key<br>X'81' | Subfield length<br>X'03' | Subfield key<br>(See note 1) |
| 4(4)                         |  |                          |                              |
| Command type<br>(See note 2) |  |                          |                              |

#### Notes:

- 1. Subfield key:
  - X'01' Single-session control (specific resource, boundary or SNI)
  - X'02' Network interconnection session control (all SNI resources)
  - X'03' All boundary sessions
  - X'04' All boundary and all SNA network interconnect (SNI) sessions
  - X'05' All sessions for a specific network addressable unit (NAU)
- 2. Command type:
  - X'01' Enable the session information retrieval (SIR) function for the resource specified in the subfield key
  - X'02' Disable the SIR function for the resource specified in the subfield key.

## Subvector Key X'81' (LPDA2 Test Modem LCS)

| Θ(Θ)              | 1(1)  |

#### Subfield Key X'20' (Set LPDA Status)

| 0(0)                     | 1(1)                  | 2(2)   |
|--------------------------|-----------------------|--|
| Subfield length<br>X'03' | Subfield key<br>X'20' | Link problem<br>determination aid<br>(LPDA) status<br>(See note) |

Note: LPDA status:

• X'00' Prevented • X'01' Allowed

# Subvector Key X'81' (Directed Action)

| 0(0)                      | 1(1)                                       | 2(2)             |
|---------------------------|--|------------------|
| Subvector length<br>X'03' | Directed actions<br>subvector key<br>X'81' | Directed action* |

<sup>\*</sup> Indicates a byte expansion follows.

#### **Byte Expansions**

| Offset/Field<br>Name | Bit Pattern/<br>Hex Value | Contents                     |
|----------------------|---------------------------|------------------------------|
| 2(2)                 |                           | Directed action              |
|                      | X'00'                     | Undefined-no action required |
|                      | X'01'                     | CMIP alarm                   |

## Subvector Key X'82' (Reply Query/Set Link Station Attributes)

| Θ(Θ)              | 1(1)   |
|-------------------|--|
| Subvector length* | Reply Query/Set Link<br>Station Attributes<br>subvector key<br>X'82' |

<sup>\*</sup> The subvector length is equal to the sum of subfield lengths plus 2. Subfield keys X'01' and X'02' are presented together in this order; the subfield length is equal to X'04'. Subfield key X'20' is presented alone; the subfield length is equal to X'03'.

#### Subfield Key X'01' (Reply Transmit Data Threshold)

| 0(0)                     | 1(1)                  | 2(2)   |
|--------------------------|-----------------------|--|
| Subfield length<br>X'04' | Subfield key<br>X'01' | Threshold value. SDLC (CUBSRTR)** BSC/SS (DVBSRTR)** |

<sup>\*\*</sup> Indicates the control block field from which this NMVT field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

#### Subfield Key X'02' (Reply Transmit Error Threshold)

| 0(0)                     | 1(1)                  | 2(2)   |
|--------------------------|-----------------------|--|
| Subfield length<br>X'04' | Subfield key<br>X'02' | Threshold value. SDLC (CUBSRTR)** BSC/SS (DVBSRTR)** |

<sup>\*\*</sup> Indicates the control block field from which this NMVT field is loaded. (See Volume 1 Section 1, "Data Area Layouts," for field definitions.)

#### Subfield Key X'20' (Reply LPDA Status)

| 0(0)                     | 1(1)                  | 2(2)  |
|--------------------------|-----------------------|---|
| Subfield length<br>X'03' | Subfield key<br>X'20' | Link Problem Determination Aid (LPDA) support: X'00' = Prevented X'01' = Allowed. |

### Subvector Key X'82' (Reply SIR Control)

| 0(0)                                 | 1(1)  | 2(2)                     | 3(3)                         |
|--------------------------------------|---|--------------------------|------------------------------|
| Subvector length<br>X'05'            | Reply SIR control<br>subvector key<br>X'82' | Subfield length<br>X'03' | Subfield key<br>(See note 1) |
| 4(4)                                 |   |                          |                              |
| Command acknowledged<br>(See note 2) |   |                          |                              |

#### Notes:

- 1. Subfield key:
  - X'01' Reply single-session control (specific resource, boundary or SNI)
  - X'02' Reply network-interconnection sessions control (all SNI resources)
  - X'03' Reply all boundary sessions
  - X'04' Reply all boundary and all SNA network interconnect (SNI) sessions
  - X'05' Reply all sessions for a specific network addressable unit (NAU)
- 2. Command acknowledged:
  - X'01' Session information retrieval (SIR) function has been enabled
  - X'02' SIR function has been disabled

## Subvector Key X'83' (Query SIR Data)

| 0(0)                      | 1(1)                                     | 2(2)                     | 3(3)         |

| LPDA support type<br>(See note) |   |                          |   |

#### Note: LPDA support:

- X'00' LPDA support inhibited
- X'01' LPDA support for IBM 3863, 3864, 3865, and 3868 modems
- X'02' LPDA support for IBM 3867 link diagnostic unit
- X'03' LPDA2 support for 586X modems

### Subvector Key X'86' (SIR Control Block xxx)

Valid session information retrieval (SIR) control blocks include the following:

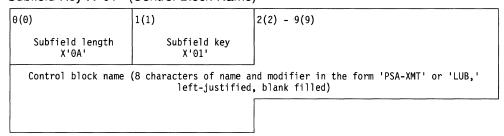

- adapter control block extension (AXB)
- boundary session block (BSB)
- boundary session block extension (BXI)
- character control block (CCB)
- character control block for OEM lines (CCB-OEM)
- common physical unit block (CUB)
- line control block (LKB)
- LU terminal node extension (LTX)
- LU control block (LUB)
- LU control block extension (LXB)
- network interconnection extension (NIX)
- programmed resource LU block/ programmed resource LU block extension (NLB/NLX)
- parameter/status area-receive or parameter/status area-transmit (PSA-RCV/PSA-XMT)
- physical services control block (PSB)
- physical services control block identifier (PSB-ID)
- SSCP-NCP session control block (SNP).

| 0(0)              | 1(1)   |
|-------------------|--|
| Subvector length* | SIR Control Block xxx<br>subvector key X'86' |

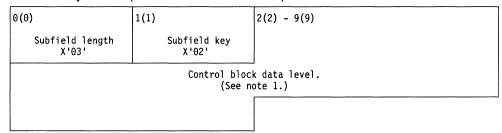

<sup>\*</sup> The subvector length is equal to the sum of the subfield lengths plus 2.

Note: Each subvector key X'86' will contain a subfield key X'01', a subfield key X'02', and a subfield key X'03' (in that order) for each SIR control block.

#### Subfield Key X'01' (Control Block Name)

#### Subfield Key X'02' (Control Block Data Level)

#### Notes:

- 1. X'00' indicates the control block that is defined by subvector key X'86' (contains Version 4 data).
- 2. Subfield key X'02' will be followed by one of the following subfield key X'03' control block data formats.

## Subvector Key X'86' (SIR Control Block AXB)

Subfield Key X'03' (AXB/ATT Control Block Data)

|  | ·  | •                                 |   |

<sup>\*</sup> See note, and see Table 16-3 on page 16-176.

### Note: Alert types:

- X'01' Permanent loss of availability
- X'02' Temporary loss of availability
- X'0A' Warning
- X'10' Permanently affected resource.

Table 16-3 (Page 1 of 5). Alert Types for the Basic Alert Subvector Key

| Alert<br>code | Alert<br>type | Alert description                   | Detail description  | Probable cause           | User action   |
|---------------|---------------|-------------------------------------|---|--------------------------|---|
| 01            | 01            | Physical link activation failure    | A hardware error in the TIC was detected during TIC activation  | TIC                      | This may not be a persistent error, so try to activate the physical line again. If the problem persists, contact an IBM service representative.   |
| 02            | 01            | Physical link activation failure    | The parameters that NTRI passed to the TIC at TIC initialization time are invalid.  | User or NCP<br>(NTRI)    | Verify that there is not a TIC Type 1 in the 3745 with a TIC Type 2 definition statement in NCP sysgen. If that is not the case, it is likely that a NTRI internal problem exists, so contact an IBM software service representative.             |
| 03            | 01            | Physical link activation failure    | A hardware error at the TRM/TIC interface was detected at TIC initialization time.  | TRM or TIC               | This may not be a persistent error, so try to activate the physical line again. If the problem persists, contact an IBM service representative.   |
| 04            | 01            | Physical link activation failure    | A TIC activation was attempted while its the associated TRM was not operational due a TRM error.  | TRM                      | Review the most recent events for this physical link, and contact an IBM service representative.  |
| 05            | 01            | Physical link<br>time-out failure   | The TIC did not respond to a NTRI command within 30 seconds.  | TIC                      | This may not be a persistent error, so try to activate the physical line again. If the problem persists, contact an IBM service representative.   |
| 06            | 01            | Physical link<br>time-out failure   | The TRM did not respond to a NTRI command within 30 seconds.  | TRM                      | This may not be a persistent error, so try to activate the physical line again. If the problem persists, contact an IBM service representative.   |
| 07            | 01            | Physical link<br>activation failure | The TIC detected another device on the ring it is attached to with the same token-ring MAC address as the TIC.  | User                     | Determine the MAC addresses of the devices in the token-ring network, and ensure that no two devices with the same address are on the same ring. Two devices may have the same MAC address as long as they are on separate rings.                 |
| 08            | 01            | Physical link activation failure    | The parameters that NTRI passed to the TIC at TIC open time are invalid.  | Possibly NCP<br>(NTRI)   | Try to reactivate the physical link; if the problem persists, contact an IBM software service representative.   |
| 09            | 01            | Physical link activation failure    | When the TIC attempted to insert onto the ring during TIC open time, it detected a non-specific ring failure.   | Token-ring LAN<br>or TIC | Try to reactivate the physical link; if the problem persists, contact an IBM service representative.  |
| OA            | 01            | Physical link<br>activation failure | When the TIC attempted to insert onto the ring during TIC open, it detected a lobe media error (loss of signal from the ring). This error indicates a loose or disconnected cable between the TIC and the MAU. It may also indicate a defective cable or a defective MAU. | Loose cable connection   | Check all connections and try to reactivate the physical link. If it still fails, connect the cable to another plug on the MAU. If that doesn't work, replace the cable. If the problem persists, contact the local token-ring LAN administrator. |

Table 16-3 (Page 2 of 5). Alert Types for the Basic Alert Subvector Key

| Alert<br>code | Alert<br>type | Alert description  | Detail description   | Probable cause                 | User action   |
|---------------|---------------|--|--|--------------------------------|---|
| 0B            | 01            | Physical link<br>activation failure                              | When the TIC attempted to insert onto the ring during TIC open time, it detected a token-ring failure such as loss of signal or frame timeout.   | Token-ring LAN                 | This may not be a persistent problem, so try to reactivate the physical link; if the problem persists, contact the local token-ring LAN administrator.  |
| 0C            | 01            | Physical link activation failure                                 | When the TIC attempted to insert onto the ring during TIC open, it received a signal from the <i>parameters</i> server (a device on the ring) to remove itself from the ring.  | Parameters<br>server error     | This may not be a persistent problem, so try to reactivate the physical link and if the problem persists, then contact the local token-ring LAN administrator.  |
| 0D            | 01            | Physical link<br>activation failure                              | When the TIC attempted to insert onto the ring during TIC open it detected an abnormal signal on the ring. This may be due to ring beaconing or the adapter attempting to insert onto the ring at a different ring speed.  | Token-ring LAN<br>or user      | Ring beaconing may be a temporary condition, so wait 30 seconds and try to reactivate the physical link. If the problem persists, verify that the speed of the ring matches the speed specified by the TRSPEED keyword on the physical link definition statement. If the problem still persists, contact your local token-ring LAN administrator. |
| 0E            | 01            | Physical link<br>INOP due to<br>receiving a<br>remove<br>command | A device on the token-ring sent a Remove command to this TIC, which caused the TIC to de-insert from the ring. The physical link, as well as all its associated logical links, are INOPed.   | Other token-ring<br>LAN device | Contact the token-ring operator or administrator to determine what device sent the REMOVE command and why it was sent.  |
| OF            | 01            | Physical link<br>error due to per-<br>manent<br>beaconing        | There is a hard error on the token-ring which has not been recovered by the beaconing process. Data transmission to the token-ring has been suspended and all logical links associated with this physical link have been INOPed. The physical link will remain active and inserted in the ring; report beaconing recovery when that occurs.              | Token-ring LAN                 | Contact the token-ring operator or administrator to determine the cause of the permanent beaconing condition.   |
| 10            | 01            | Physical link<br>INOP due to<br>loss of con-<br>nection          | When the TIC attempted to insert onto the ring during TIC open, it detected a lobe media error (loss of signal from the ring). The physical link, as well as all its associated logical links, are INOPed. This alert indicates a loose or disconnected cable between the TIC and the MAU, or it may also indicate a defective cable or a defective MAU. | Loose cable connection         | Check all connections and try to reactivate the physical link. If it still fails, connect the cable to another plug on the MAU. If that doesn't work, replace the cable. If the problem persists, contact the local token-ring LAN administrator.   |

Table 16-3 (Page 3 of 5). Alert Types for the Basic Alert Subvector Key

| Alert<br>code | Alert<br>type | Alert description  | Detail description   | Probable cause     | User action  |
|---------------|---------------|--|--|--------------------|--|
| 11            | 01            | Physical link<br>INOP due to<br>auto-removal<br>process            | The TIC removed itself from the ring after detecting an error during a self-test. The self-test was performed as part of the beaconing process. The physical link, as well as all its associated logical links, are INOPed.  | TIC                | This may not be a persistent problem, so try to reactivate the physical link; if the problem persists, contact an IBM service representative.  |
| 12            |               | Unused   |  |                    |  |
| 13            | 02            | Physical link<br>recovery -<br>beacon process<br>ended             | The token-ring has recovered after a beacon process.   | None               | None   |
| 14            |               | Unused   |  |                    |  |
| 15            |               | Unused   |  |                    |  |
| 16            | 01            | Physical link<br>INOP due to<br>deadman timer<br>expiration        | The TIC did not interrupt NTRI for a period of time, so NTRI issued a command to the TIC to request the TIC to interrupt NTRI. After the TIC didn't interrupt NTRI, NTRI detects an error. The physical link, as well as all its associated logical links, are INOPed.   | TIC or TRM         | This may not be a persistent problem, so try to reactivate the physical link; if the problem persists, contact an IBM service representative.  |
| 17            | 01            | Physical link<br>INOP due to an<br>interrupt proc-<br>essing error | NTRI detects an error during the processing of an interrupt from the TIC. The physical link, as well as all its associated logical links, are INOPed.  | TIC or TRM         | This may not be a persistent problem, so try to reactivate the physical link; if the problem persists, contact an IBM service representative.  |
| 18            | 01            | Physical link<br>failure on 3720<br>due to a sysgen<br>error       | NTRI detects a discrepancy between the NCP sysgen and the information received from MOSS at IPL time in the CDF. The physical link, as well as all its associated logical links, are INOPed.   | User               | Check the ADDR keyword of the physical link line statement. Correct this if necessary and reactivate the physical link. If the problem persists, contact an IBM service representative.  |
| 19            | 01            | Physical link<br>INOP due to<br>hardware error<br>interrupt        | A Level 1 interrupt occurred to report a hardware error. The problem may be that MOSS has issued a disconnect line command or that the TRM is not installed and an attempt was made to use it or that a real hardware failure exists in the TIC, TRM or CCU. The physical link, as well as all its associated logical links, are INOPed. | TIC, TRM or<br>CCU | Review the BER log at the MOSS console for a more specific description of the problem. This may not be a persistent problem, so try to reactivate the physical link. If the problem persists, contact an IBM service representative. |

Table 16-3 (Page 4 of 5). Alert Types for the Basic Alert Subvector Key

| Alert<br>code | Alert<br>type | Alert description   | Detail description   | Probable cause                             | User action  |
|---------------|---------------|---|--|--|--|
| 1A            | 01            | Physical link<br>INOP due to<br>unknown cause                         | Something caused a physical link INOP, but the cause could not be reported by NTRI due to a buffer depletion condition in the CCU. The physical link, as well as all its associated logical links, are INOPed.   | Unknown                                    | This may not be a persistent problem, so try to reactivate the physical link. I the problem persists, contact an IBM service representative.   |
| 18            | 01            | Logical link activation failure - timeout                             | NTRI timed-out trying to establish a connection with another device on the ring. The problem may be that the other device is powered off or not initialized, or that the dial digits on the PATH macro of the VTAM definition statement are incorrect. There may also be a failure in NTRI or in the other device.   | User error, other<br>device, NCP<br>(NTRI) | Investigate and correct any suspected causes and try to reactivate the logica link. If the problem persists, run a line trace and contact an appropriate service representative.             |
| 1C            | 10            | Logical link<br>INOP due to<br>physical link<br>failure               | A physical link failure caused this logical link to be INOPed.   | Physical link                              | Investigate the cause of the physical link failure.  |
| 1D            | 01            | Logical link activation failure - invalid dial digits                 | NTRI received invalid dial digits in the connect-out command from VTAM. The problem may be that the VTAM definition statement for DIALNO on the PATH statement is incorrect or that NTRI is not processing valid digits correctly.   | User or NCP<br>(NTRI)                      | Check the VTAM generation statements and make sure that they are coded correctly and attempt to reactivate the logical link. If the problem persists, contact an IBM service representative. |
| 1E            | 01            | Logical link acti-<br>vation failure -<br>physical link not<br>active | NTRI receives a logical link outgoing call request via a connect-out from VTAM and then detects that the physical link is not operational.   | User or NCP<br>(NTRI)                      | Make sure the physical link is active, then try to reactivate the logical link. If the problem persists, contact an IBM service representative.  |
| 1F            | 02            | Logical link activation failure incoming call refused                 | NTRI receives an incoming call from another device, but cannot accept it because no logical links are available. The problem may be that logical links associated with the physical line are not active or that too many logical connections are requested on the same physical link. The problem may also be that the logical links are not defined with CALL=IN or CALL=INOUT on the line macro. | User                                       | Investigate the possible causes, then try to reactivate the logical link. If the problem persists, contact an IBM service representative.  |
| <br>20        |               | Unused  |  |  |  |

Table 16-3 (Page 5 of 5). Alert Types for the Basic Alert Subvector Key

| Alert<br>code | Alert<br>type | Alert<br>description   | Detail description   | Probable cause | User action  |
|---------------|---------------|--|--|----------------|--|
| 21            | 02            | Logical link activation failure - contention                       | While NTRI is attempting an outgoing call, the device it is calling is attempting to call in. This alert indicates that NTRI has chosen to cancel its outgoing call and process the incoming call. | None           | This may not be a persistent problem, but if it persists and the connections fail, contact an IBM service representative.  |
| 22            | 01            | Physical link<br>INOP due to an<br>interrupt proc-<br>essing error | NTRI detects an error during the processing of an interrupt from the TRM. The physical link, as well as all its associated logical links, are INOPed.  | TRM            | This may not be a persistent problem, so try to reactivate the physical link; if the problem persists, contact an IBM service representative.  |
| 23            | 01            | Physical link<br>activation failure<br>following TIC<br>dump       | The user is attempting to activate the physical link while MOSS is in the process of dumping the TIC.  | User           | Wait 30 seconds, then reactivate the physical link. If the problem persists, use the MOSS operator function to reset the Activate Link Inhibit bit to reactivate the link again. If the problem persists, contact an IBM service representative. |
| 24            | 01            | Frame received was too long  | Frame was received from a device on the token-ring which is larger than the value coded for RCVBUFC.   | Other device   | Change the value coded on the RCVBUFC keyword to accommodate the frame received from the adjacent station, or change the parameters of the device to cause it to send frames smaller than the current value of RCVBUFC.                          |

<sup>\*</sup> Indicates a byte expansion follows.

- 1. This field consists of one of the following values:
  - X'01' Permanent loss of availability.
  - X'02' Temporary loss of availability.
  - X'03' Performance is below an acceptable level.
  - X'11' Impending, but not yet realized loss of availability to the end user.
  - X'12' Severity of problem is unknown.
  - X'14' Loss of availability has been bypassed.
- 2. This field consists one of the following 2-byte description codes:
  - For ODLC Token-Ring Logical Resource Failure Caused by Failure of the Physical Resource X'1010' Adapter Error
  - For ODLC Permanent Station/Link Error (Outboard DLC Error)
    - X'1603' Communications Subsystem Failure
  - For NCST Logic Error, FRPE Microcode Mismatch Alerts X'2100' Software program error.
  - For ODLC Permanent Station/Link Error (NCP Programming Error)
     X'2101' Programming Procedure Incorrect
  - For SNA Protocol Error Alert:
    - X'3100' SNA protocol error.
  - For ODLC Token-Ring Connout Failure Physical Resource Not Operational X'3200' Token-Ring Error
  - For ODLC Token-Ring Connout Failure Due to Collision With Incoming Call X'3200' Token-Ring Error
  - For the Ethernet CSMA/CD LAN No-carrier Alert:
    - X'3221' CSMA/CD LAN communications lost.
  - For the Common Management Information Protocol (CMIP) Link Data Alert: X'3300' Link Error.
  - For the Common Management Information Protocol (CMIP) Station Data Alert: X'3300' Link Error.
  - Default:
    - X'3302' Unable to communicate with the device.
  - For the Frame-relay Logical Line Lost Because Physical Line Lost Alert: X'3617' DCE interface error.
  - For Frame-relay Logical Line Activation failure alerts

X'3641' Logical Line Activation Failure

• For Frame-relay LMI Error Threshold Exceeded Alert:

X'4012' Threshold has been reached.

For VR Held Time Limit Reached Alert:

X'500C' A congested VR has been in the held state for longer than a defined time limit.

• For VR Pacing Withheld Time Limit Reached Alert:

X'500D' A congested VR endpoint has not sent a virtual route pacing response for longer than a defined time limit.

• For Held VR Deactivation Time Limit Reached Alert:

X'500E' A congested VR has been deactivated since it was in a held state for longer than a defined time limit.

• For VR Transmit Queue Overrun Alert:

X'500F' The size of a VR Transmit Queue has exceeded a defined threshold for longer than a defined time limit.

For Usage Tier Exceeded Alert:

X'5114' Authorized Software Usage Exceeded

• For Frame-relay Associated FRSE Deleted Alert:

X'7000' Operator Procedural Error.

• For the Frame-relay Logical Line Lost Because Physical Line Forced Deactivated Alert:

X'7001' Resources not active.

 For ODLC Token-Ring - Notify Call Indication LDPSA Rejection Due to No Logical Resources Available

X'7001' Resources not active.

For ODLC Permanent Link Error Alert - ESCA Forced Deactivation

X'7001' Resources not active.

• For Frame-relay DLCI Mismatch Alert:

X'8000' Configuration Error.

For Frame-relay LMI Configuration Mismatch Alert:

X'8000' Configuration Error.

• For Frame-relay DLCI Deleted Alert:

X'8000' Configuration Error.

For Frame-relay FRSE Substitute Failure due to LMI Configuration Mismatch Alert:

X'8000' Configuration Error.

• For ODLC Token-Ring - Connout Failure - Invalid Dial Digits

X'8000' Configuration Error.

• For Frame-relay DLCI Inactive Alert:

X'FE01' Resource Unavailable.

· For Alert Threshold for Dynamic Control Blocks Reached Alert

X'5105' Memory Usage Threshold Reached

• For Buffers for Dynamic Control Blocks Depleted Alert

X'5105' Memory Usage Threshold Reached

· For Allocation for Dynamic Control Blocks Failed: Too Close to Slowdown Alert

X'5003' Capicity Exceeded

For First Dynamic Control Block Allocated Alert

X'8000' Configuration or Customization Error

• For Allocation for Control Block Failed du to Gennable Limit Alert

X'8000' Configuration or Customization Error

For Down-Level ESS Adapter Microcode Alert:

X'6300' Microcode Program Mismatch

• For Owning-TCP/IP-Host's-NCPROUTE-application-down Alert:

X'2122'IP Dynamic Routing Data Not Received

For Bad-NCPROUTE-Datagram Alert:

X'330C'Error Receiving IP Dynamic Routing Data

- For VR Out-of-Sequence Alert X'2110' VR has gone out-of-sequence.
- 3. This field consists of one of the following values:
  - X'0B46F1FF' Frame-relay Associated FRSE Deleted Alert.
  - X'0D9CB673' ODLC Permanent Link Error ESCA Forced Deactivation
  - X'0EB9B8AD' Line in use on other CCU Alert.
  - X'0F825E10' V.25 bis and Sandkey modem dial failure.
  - X'36775528' Frame-relay LMI Error Threshold Exceeded Alert.
  - X'40E1FA7F' Frame-relay LMI Configuration Mismatch Alert.
  - X'483F3EC5' Frame-relay logical line lost because Physical Line Force Deactivated.
  - X'5632C759' Frame-relay DLCI Inactive Alert.
  - X'668E036D' Ethernet CSMA/CD LAN No-carrier Alert.
  - X'6931D5FC' VR Transmit Queue Overrun Alert.
  - X'7BF136E1' VR Held Time Limit Reached Alert.
  - X'889BF5FE' Frame-relay logical line lost because Physical Line Lost.
  - X'89F19C87' VR Pacing Withheld Time Limit Reached Alert.
  - X'89F692C2' ODLC Token-Ring Notify Call Indication LDPSA Rejection Due to No Logical Resources Available Deactivation
  - X'8AAEB81D' Frame-relay DLCI Mismatch Alert.
  - X'912257AE' NCST Logic Error Alert.
  - X'98BEF9B3' Frame-relay FRSE Substitute Failure due to LMI Configuation Mismatch Alert.
  - X'993338D2' ODLC Permanent Station/Link Error (NCP Programming Error).
  - X'9A0CAA7F' ODLC Permanent Station/Link Error (Outboard DLC Error).
  - X'9B317F9A' Held VR Deactivation Time Limit Reached Alert.
  - X'9D8E8458' ODLC Token-Ring Connout Failure Due to Collision With Incoming Call Deactivation
  - X'ABA27E3A' Frame-relay DLCI Deleted Alert.
  - X'B756BD60' ODLC Token-Ring Connout Failure Invalid Dial Digits
  - X'BDC2FEFD' ODLC Token-Ring Connout Failure Physical Resource is Not Operational
  - X'DA036CB5' Usage Tier Exceeded Alert
  - X'EE5205EC' SNA Protocol Error Alert.
  - X'E5C08E4C' Alert Threshold for Dynamic Control Blocks Reached Alert

### Subfield Key X'81' (Recommended Actions Subfield)

| 0(0)              | 1(1)                  | 2(2)                                 |
|-------------------|-----------------------|--------------------------------------|
| Subvector length* | Subfield key<br>X'81' | Subfield code points.<br>(See note.) |

<sup>\*</sup> The subfield length is equal to the size of the recommended actions code points plus 2.

Note: This field consists of one or more of the following 2-byte recommended actions subfield code points:

- X'0037' Increase size of resource
- X'0103' Verify the telephone number.
- X'015C' Verify configuration file
- X'01A1' Verify (sf 85)
- X'0403' Run modem tests.
- X'1204' Attempt to reestablish the connection.
- X'1208' Retry request
- X'1332' Reactivate line.
- X'14A5' Restart (sf85)
- X'14A2' Activate.
- X'2010' Review link detailed data.
- X'2012' Review associated resources
- X'2102' No text
- X'2203' Review support data
- X'3000' Contact appropriate service representative.
- X'30E1' Contact service representative for ODLC token-ring.
- X'3102' Contact CSMA/CD administrator responsible for this LAN.
- X'3110' Contact communications systems programmer
- X'3301' If problem persists then do the following
- X'32A0' Report the following: (sense byte provided by subfield X'82').
- X'3302' If problem persists then do the following:
- X'32D0' Report the following (sf85) (sf85) (sf85)
- X'3303' If unsuccessful then do the following:

### Subfield Key X'82' (Detailed Data Subfield)

| 0(0)                         | 1(1)  | 2(2)                         | 3(3)                      |
|------------------------------|---|------------------------------|---------------------------|
| Subfield length*             | Subfield key<br>X'82'   | Subfield product ID<br>X'00' | Data ID.<br>(See note 1.) |
| Data encoding. (See note 2.) | 5(5) - r  Detailed data (for example, a sense code value).  (See note 3.) |                              |                           |

<sup>\*</sup> The subfield length is equal to the size of the detailed data plus 5.

#### Notes:

- 1. This field contains one of the following values:
  - X'00' No canned words will be displayed by NetView.
  - X'10' "Sense Code" will be displayed by NetView.
  - X'13' "Status Code" will be displayed by NetView.
  - X'14' "Symptom" will be displayed by NetView
  - X'52' "Line Address" will be displayed by NetView.
  - X'53' "Line Address Range" will be displayed by NetView.
  - X'55' "Line" will be displayed by NetView.
  - X'61' "Adapter Number" will be displayed by NetView.
- 2. This field contains one of the following values:
  - X'00' Detailed data is in hexadecimal.
  - X'11' Detailed data is in EBCDIC.
- 3. If the data ID field at offset 3(3) contains a value of X'13' (status code), then the detailed data field (offset 5(5)) contains 4 bytes of status data in hexadecimal. For the meaning of the first 2 bytes, 5(5)-6(6), see the LXBSTAT and LXBSTATC fields. For the meaning of bytes 7(7) and 8(8), see the line communication status (LCS) and extended line communication status (ELCS) fields in the parameter/status area control block (PSA). However, if byte 7(7) (LCS value) is X'EA' (delayed call), then the next 2 bytes, 8(8)-9(9), contain a decimal representation of the time delay required before the operator should retry the call request. For the Ethernet CSMA/CD LAN No-Carrier Alert, byte 3 will contain X'61' (adapter number), and byte 5 will contain the adapter number, in hexadecimal, if installed or X'FF' if not installed. For the SNA Protocol Error Alert and NCST Logic Error Alert, bytes 5(5)-8(8) will be the first four bytes of the FEB for the first sf82 and the second sf82 will contain from 5-12 consecutive bytes from the PIU beginning with TH1DCF.

### Subfield Key X'83' (Product Set ID Index)

| 0(0)             | 1(1)                  | 2(2)                     |
|------------------|-----------------------|--------------------------|
| Subvector length | Subfield key<br>X'83' | Product ID Code<br>X'91' |

### Subfield Key X'85' (Detailed Data Extended Subfield)

| 0(0)                           | 1(1)                  | 2(2)                           | 3(3)                |  |

| Subfield length*               | Subfield key<br>X'85' | Product ID code<br>(X'00')     | Reserved<br>(X'00') |  |
| 4(4)                           |                       | 6(6)                           | 7(7) - P            |  |
|                                | a ID<br>ote 1.)       | Data encoding<br>(See note 2.) |                     |  |
| Detailed data<br>(See note 3.) |                       |                                |                     |  |

<sup>\*</sup> The subfield length is equal to the size of the detailed data field plus 7.

- 1. This field consists of one of the following 2-byte data ids:
  - X'0000' No Display
  - X'0035' Type
  - X'0056' DTE Adress Called
  - X'0060' Port Number
  - X'00FE' Internet Protocol Address
  - X'0129' DSAP
- 2. This field consists of one of the following data encoding types:
  - X'00' HEX
  - X'11' EBCDIC
- 3. This field consists of detailed data encoded as specified in byte 6 (data encoding).

# Subvector Key X'97' (Generic Alert Cause Undetermined)

| Subvector length* | Subfield key<br>X'81' | Subfield code points.<br>(See note.) |

<sup>\*</sup> The subfield length is equal to the size of the recommended actions code points plus 2.

Note: This field consists of the following 2-byte recommended actions subfield code points:

- X'00B0' Perform problem determination for (sense byte provided by subfield X'82')
- X'0103' Verify telephone number
- X'010A' Check configuration of sending node
- X'010D' Check configuration of remote node
- X'0403' Run modem tests
- X'1204' Attempt to reestablish connection
- X'1208' Retry request
- X'1332' Reactivate line
- X'13A1' Activate resources attached to ...
- X'13A2' Deactivate resources attached to ...
- X'1412' Restart resource
- X'14A2' Activate
- X'14A4' Vary or connect (sf85) online
- X'1501' Correct generation problem
- X'1503' Correct configuration
- X'2010' Review link detailed data
- X'2012' Review associated resources
- X'2100' Review recent alerts for this resource
- X'2102' No text
- X'2203' Review support data
- X'3000' Contact service representative
- X'30E1' Contact service representative for ...
- X'3102' Contact CSMA/CD administrator responsible for this LAN
- X'310B' Contact network administrator
- X'310C' Contact administrator of affected resources
- X'3110' Contact communication systems programmer
- X'3112' Contact system programmer
- X'3125' Contact remote link station operator
- X'32A0' Report the following: (sense byte provided by subfield X'82')
- X'32C0' Report the following:
- X'3301' If problem persists, then do the following:
- X'3302' If problem persists, do the following:
- X'3303' If unsuccessful, then do the following:
- X'35E0' Refer to product documentation for additional information (sense byte provided by subfield X'83')

### Subfield Key X'82' (Detailed Data Subfield)

| 0(0)                            | 1(1)                            | 2(2)                         | 3(3)                      |
|---------------------------------|---------------------------------|------------------------------|---------------------------|
| Subfield length*                | Subfield key<br>X'82'           | Subfield product ID<br>X'00' | Data ID.<br>(See note 1.) |
| 4(4)                            | 5(5) - r                        |                              |                           |
| Data encoding.<br>(See note 2.) | Detailed data.<br>(See note 3.) |                              |                           |

<sup>\*</sup> The subfield length is equal to the size of the detailed data plus 5.

- 1. This field contains the following value:
  - X'00' No canned words will be displayed by NetView.
  - X'4F' Active Route
- 2. This field contains one of the following values:
  - · X'00' Detailed data is in hexadecimal.
  - X'11' Detailed data is in EBCDIC.
- 3. For the VR Held Time Limit Reached Alert, the VR Pacing Withheld Time Limit Reached Alert, the Held VR Deactivation Time Limit Reached Alert, the VR Transmit Queue Overrun Alert, and the VR Out-of sequence Alert, the detailed data is defined as the following: Bytes 5(5) - 12(C) will be the NETID. Bytes 13(D) - 16(10) will be the alert sender subarea. Bytes 17(11) - 20(14) will be the other end subarea. Byte 21(15) will be the VRID: X'yz' where y = VRN and z = TPF. Byte 22(16) will be ERN/RERN:X'yz' where y = ERN and z = RERN.

### Subfield Key X'82' (Detailed Data Subfield)

| 0(0)                            | 1(1)                            | 2(2)                         | 3(3)                      |
|---------------------------------|---------------------------------|------------------------------|---------------------------|
| Subfield length*                | Subfield key<br>X'82'           | Subfield product ID<br>X'00' | Data ID.<br>(See note 1.) |
| 4(4)                            | 5(5) - r                        |                              |                           |
| Data encoding.<br>(See note 2.) | Detailed Data.<br>(See note 3.) | ·                            |                           |

<sup>\*</sup> The subfield length is equal to the size of the detailed data plus 5.

#### Notes:

- 1. This field contains the following value:
  - X'13' "Sense Code" will be displayed by NetView.
- 2. This field contains one of the following values:
  - X'00' Detailed data is in hexadecimal.
  - X'11' Detailed data is in EBCDIC.
- 3. For the VR Held Time Limit Reached Alert, the VR Pacing Withheld Time Limit Reached Alert, the Held VR Deactivation Time Limit Reached Alert, and the VR Transmit Queue Overrun Alert, the detailed data is defined as the following: Byte 5(5) will be the minimum window size. Byte 6(6) will be the maximum window size. Byte 7(7) will be the current window size. Bytes 8(8) - 9(9) will be the number of PIUs on the VR transmit queue. Byte 10(A) will be the VR transmit queue depth alert threshold for this VR. Bytes 11(B) - 12(C) will be the VR status flags. Bytes 13(D) - 14(E) will be the VR PIU pool count. Bytes 15(F) - 16(10) will be the VR PIU pool threshold. Bytes 17(11) - 20(14) will be duration of congestion in seconds.

For the VR Out-of-Sequence Alert, the detailed data is defined as the following: Bytes 5(5) - 6(6) will be the next expected sequence number (when the out-of-sequence PIU was received). From bytes 7(7), the TH4/RH/RU(up to 5 bytes) portion of the out-of sequence PIU is saved. The length of this portion is a variable, because the RU length may be less than 5 bytes.

# Subvector Key X'A0' (CNM Detailed Qualifier EBCDIC)

| e | (0)                                | 1(1)   | 2(2) - 5(5) or 7(7) |
|---|------------------------------------|--|---------------------|
|   | Subvector length<br>X'05' or X'08' | CNM detailed<br>qualifier EBCDIC<br>subvector key<br>X'A0' | EBCDIC characters   |

Physical Link Example—If NCP/token-ring interconnection (NTRI) wants to report the value 1234, the subvector is coded as follows:

| 0(0)                      | 1(1)                          | 2(2)   |
|---------------------------|-------------------------------|--|
| Subvector length<br>X'05' | Subvector key<br>X'A0'        | Detail qualifier<br>X'F1F2'<br>(bytes 1 and 2) |
| 4(4)                      |                               |  |
| X'F:                      | qualifier<br>3F4'<br>3 and 4) |  |

This subvector contains the NCP line interface address (up to 3 decimal bytes).

Logic Link Example—If NTRI wants to report the value LANLK1, the subvector is coded as follows:

| 0(0)                      | 1(1)                   | 2(2) - 7(7)           |
|---------------------------|------------------------|-----------------------|
| Subvector length<br>X'08' | Subvector key<br>X'A0' |                       |
|                           |                        | qualifier<br>5D3D2F1' |

This subvector contains the SNA symbolic name of the associated physical link (up to 8 EBCDIC bytes).

# Subvector Key X'A1' (CNM Detailed Qualifier—Hexadecimal)

| 0(0)                      | 1(1)  | 2(2) - 9(9)       |
|---------------------------|---|-------------------|
| Subvector length<br>X'0A' | CNM detailed<br>qualifier hexadecimal<br>subvector key<br>X'A1' | Hexadecimal bytes |

This subvector contains internal error information (up to 8 hexadecimal bytes).

Physical Link Example—If NCP/token-ring interconnection (NTRI) wants to report the value X'123456789ABCDEF', the subvector is coded as follows:

```
0(0)
Subvector length
X'0A'

Detail qualifier
X'123456789ABCDEF'
```

In some cases, NTRI also generates another X'A1' (hexadecimal) subvector containing SSB completion bytes or the adapter check status (up to 8 hexadecimal bytes).

Logic Link Example—If NTRI wants to report the value X'123456789ABCDEF', the subvector is coded as follows:

```
0(0)
Subvector length
X'0A'

Detail qualifier
X'123456789ABCDEF'
```

In some cases, NTRI also generates another X'A1' (hexadecimal) subvector containing transmit completion bytes (up to 8 hexadecimal bytes).

# Section 17. Network Performance Monitor (NPM) Request Unit (RU) Formats

The RUs in this section define the interface between NCP and a host application called Network Performance Monitor (NPM). The RUs allow NPM to monitor the performance of the following NCP resources:

- NCP
- Channel links
- · SDLC link and SDLC physical unit
- SDLC logical unit and programmed resource virtual logical unit
- · Token-ring physical and logical links
- BSC line supporting IBM 3270 devices exclusively, IBM 3270 BSC cluster controllers (physical units), and IBM 3270 BSC terminals (logical units).

A virtual LU within NCP processes the Start, Stop, and Forward requests sent by the host application program. This virtual LU collects performance information on the specified resources and sends this performance data to NPM, upon request, in the Collect RU. To inform NPM of dynamic resource address assignments, the LU also sends NPM RNAA/FNA RUs.

The virtual LU also supports boundary function session accounting, gateway session accounting, and IBM special products or user-written code session accounting (a subset of boundary function session accounting). For these functions, Enable Send, Disable Send, Solicit Session Counters, and Change Accounting Parameters requests sent by the host application program are also processed by the virtual LU. The virtual LU collects accounting data on boundary function sessions or gateway sessions (or both) and sends NPM Session Start, NPM Session End, and Accounting Data RUs.

The PIUs that carry the RUs defined here are function manager (FM) Data PIUs (RH byte 0, bits 1 and 2 are both off). The only other PIU that contains NPM-specific data is the BIND request/response, which flows between NPM and the virtual LU in NCP.

The BIND contains a special user data field. The format is a non-zero length of greater than 3, a non-zero first byte, a second byte equal to the length of subfield X'10', a third byte of X'10', and a status byte. The status byte is defined as shown in Table 17-1.

| Table | 1 <i>7</i> -1. | The BIND Status Byte for the NPM RUs |
|-------|----------------|--------------------------------------|
|       |                |                                      |

| Bit Pattern | Contents   |  |
|-------------|--|--|
| xx          | Reserved   |  |
| 1           | NPM is IBM special products or user-written code session accounting capable. |  |
| 1           | NPM is gateway session accounting capable.                                   |  |
| 1           | NPM wishes to receive takeover notification.                                 |  |
| 1           | NPM is capable of dynamic reconfiguration (DR).                              |  |
| 1.          | NPM is session accounting capable.   |  |
| 1           | NPM is network performance capable.  |  |

#### Control Block Pool/Table Data RU

Note: There is a dependency that RUCBDTOD, RUCBDQID, RUCBDFG1, and RUCBDTIM in the control block pool/table data RU have the same meaning and are at the same offsets as the corresponding fields in an NPM COLLECT network data RU.

#### Request Format

<sup>\*</sup> Indicates a byte expansion follows.

| Offset/Field<br>Name | Bit Pattern/<br>Hex Value | Contents  |
|----------------------|---------------------------|---|
| 61(3D)<br>RUCBDFG1   |                           | Flags   |
|                      | xxxx xx                   | Reserved  |
|                      | 1.                        | NCP has entered slowdown; discontinued processing of the FORWARD request - not used (RUCBDSL) |
|                      | 1                         | Last control block pool/table data PIU for the current FORWARD request (RUCBDLS)              |

#### X'54' NPA Control Block Pool/Table Data Control Vector

Note: As noted in the layout, the values in some of the fields have slightly different meanings for the buffer pool than for the other pools.

Note: The total number of genned control blocks/entries is the sum of the permanently assigned control blocks/entries plus the initial number of free ones plus the initial number of in-use ones.

Note: The initial total number of control blocks/entries that belong to the pool of control blocks/entries is the sum of the initial number of free ones plus the initial number of in-use ones. The permanently assigned control blocks/entries are not considered to belong to the pool.

# Section 18. NCP Storage Format for the 3745

**Note:** See the local storage map on the following page.

#### Format of the Local Storage Map

| X'yyyy000' |                          |  |
|------------|--------------------------|--|
|            | Storage keys             |  |
| X'yyyy800' | Local storage registers* |  |
| X'yyyyA00' | LSSD strings             |  |
| X'yyyyB00' | IPL ports trace X'7FF'   |  |

Where yyyy = 400, 800, C00, or 1000 depending upon whether the controller storage size is 4, 8, 12, or 16 megabytes, respectively.

The local storage map is not displayable. It appears only at the end of a dump (with the exception of a dynamic dump).

Table 18-1 (Page 1 of 2). Dump and Register Addresses for the 3745

| Dump<br>Address | Register<br>Address | Contents   |  |
|-----------------|---------------------|--|--|
| yyyy800         | 00–07               | General register group 0 (level 2)                       |  |
| уууу820         | 08–0F               | General register group 1 (level 3)                       |  |
| yyyy840         | 10–17               | General register group 2 (level 4)                       |  |
| yyyy860         | 18–1F               | General register group 3 (level 5)                       |  |
| yyyy880         | 20–27               | General register group 4 (level 1)                       |  |
| yyyy8A0         | 28–2F               | Invalid  |  |

| yyyy9F0         | 7C                  | Branch trace buffer count                                |  |
| yyyy9F4         | 7D–7F               | Invalid—hardware registers                               |  |

Warning: The values in the local storage registers 00 through 7F are those obtained by MOSS and are not necessarily the values that would be obtained if an Input instruction were executed for any given register. For details on local storage registers, see the IBM 3745 Principles of Operation manual.

| 0 -         |   | SP<br>Kev* | Read<br>Only |

# Section 19. NCP--Processor Parameter/Status Area Layouts

The following layouts make it easier to determine the exact layout of each NDPSA. See Volume 1 Section 1, "Data Area Layouts," for the generic layout of all NDPSAs.

#### **NDPSA - Activate**

Program:

NCP

Size in bytes:

32(20)

Function:

To request that the designated link be enabled.

| 0(0)   |                                 | PDPSAP<br>er to next NDPSA   |   |

# Section 20. Processor--NCP Parameter/Status Area Layouts

The following layouts make it easier to determine the exact layout of each LDPSA. See Volume 1 Section 1, "Data Area Layouts," for the generic layout of all LDPSAs.

### **LDPSA - Activate Complete**

Program:

**NCP** 

Size in bytes:

26(1A)

Function:

To notify the NCP that its ACTIVATE command is complete. The ACTIVATE could have

been issued with an ENABLE, DIAL, or SAP qualifier.

| 0(0)   |                           | PDPSAP<br>er to next LI         | DPSA              |
|--|---------------------------|---------------------------------|-------------------|
| 4(4) LDPCMD Activate complete X'01'                          | 5(5)  LDPQUAL*  Qualifier | 6(6)                            | LDPFLAGS<br>Flags |
| 8(8)   | N                         | PLLRID<br>CP.LRID<br>ter to LKE |                   |
| LDPSAP**<br>SAP field for<br>activate/deactivate<br>complete |                           |                                 |                   |
| 12(C)  |                           |                                 |                   |
|  | R                         | eserved                         |                   |
| 16(10)   |                           |                                 |                   |
|  | R                         | eserved                         |                   |

|                 | X'30'        | SAP       |  |

### **LDPSA - Connect Confirm**

Program:

NCP

Size in bytes:

26(1A)

Function:

To inform NCP of the completion status of a CONNECT REQUEST

| 0(0)  |   | DPSAP<br>next LDPSA in list            |                    |

## LDPSA - Notify - NACK

Program:

NCP

Size in bytes:

26(1A)

Function:

To signal the NCP that the processor is having trouble getting PIUs acknowledged by the

station indicated. Currently, only required for SA link stations for which NCP provides

MLTG support.

| 0(0)                              | (0)  LDPDPSAP  Chain pointer to next LDPSA in list |                                  |  |

# LDPSA - Notify/Intensive Mode Record

Program:

**NCP** 

Size in bytes:

26(1A)

Function:

Provides the NCP with intensive mode record information for the indicated station.

| 0(0)                                  |                                 |                                   |

# LDPSA - RAS Complete / Wrap Test

Program:

NCP

Size in bytes:

26(1A)

Function:

To pass the wrap test results to the NCP.

# **List of Acronyms and Abbreviations**

| Acronym | Meaning  | BGS   | background save area                        |
|---------|--|-------|---|
| AAB     | achain anchor block  | ВН    | buffer prefix                               |
| AARR    | allow additional register range                                | BHD   | block handler driver table                  |
| AB      | abort call   | BHR   | block handler routine                       |
| ABN     | abend control block  | BHS   | block handler set                           |
| ABNX    | abend control block extension                                  | BISSQ | boundary inbound session started            |
| ACB     | adapter control block  |       | queue                                       |
| ACF     | Advanced Communications Function                               | BLU   | basic link unit                             |
| ACK     | acknowledgment   | BOQ   | boundary out queue                          |
| ACR     | Abandon Call and Retry   | BOSSQ | boundary outbound session started queue     |
| ACT     | ACB trace control block  | ВРВ   | destination boundary pool (BPOOL)           |
| ACU     | auto call unit   | Dr B  | block                                       |
| AEB     | achain element block   | BPT   | boundary function processor address         |
| All     | adapter ID index   |       | table                                       |
| AIO     | adapter input/output   | BSB   | boundary session block                      |
| AIT     | adapter information table                                      | BSC   | binary synchronous communication            |
| ALC     | airline line control   | BST   | block handler set table                     |
| ALCA    | airline line control adapter                                   | втт   | branch trace table                          |
| ALS     | adjacent link station  | BTU   | basic transmission unit                     |
| ANS     | automatic network shutdown                                     | BUE   | switched backup extension to the DVB        |
| APPN    | advanced peer-to-peer networking                               | BXI   | boundary session block extension            |
| ASC     | auto-selection chain   | CA    | channel adapter                             |
| ASCII   | American National Standard Code for<br>Information Interchange | CAB   | channel adapter control block               |
| AST     | adapter status table   | CAC   | character address counter                   |
| АТВ     | address trace block  | CACM  | channel adapter concurrent mainte-<br>nance |
| ATO     | attention timeout  | CADS  | channel adapter data streaming              |
| ATT     | ACB trace table control block                                  | CAP   | channel adapter parameter table             |
| AVB     | address vector control block                                   | CAT   | channel adapter trace select table          |
| AXB     | adapter control block extension                                | CAVT  | channel adapter vector table                |
| BAR     | buffer address register  | СВВ   | committed buffers block                     |
| ВВ      | begin bracket  | СВС   | Controller bus coupler                      |
| BCA     | Boundary channel attachment                                    | СВТ   | conditional branch trace                    |
| BCC     | Block Check Character  | ССВ   | character control block                     |
| ВСТ     | BFSESSINFO PIU control table                                   | ССВХ  | character control block general             |
| BCU     | block control unit   |       | purpose extension                           |
| BER     | box event record   | CCLID | called/calling line identifier              |
| BF      | boundary function  | CCP   | communication control program               |

| CCT   | character control block for trace   | CSW   | channel status word  |
|---|---|---|--|
| CCU   | communication control unit  | СТВ   | communication line timer and RAS   |
| CCW   | channel command word  |   | control table  |
| CDDO  | cycle-steal dynadump data out queue   | CTS   | Clear to Send  |
| CDRM  | Cross-domain Resource Manager   | СТТ   | table of CNVT pointers   |
| CDS   | configuration data set  | CUB   | common physical unit block   |
| CE  | channel end   | CUC   | cycle utilization counter  |

## **Bibliography**

### NCP, SSP, and EP Library

The following paragraphs briefly describe the library for NCP, SSP, and EP. The other books dealing with the networking systems products—VTAM, NPSI, the NetView program, and NPM—are listed without the accompanying descriptions.

NCP V7R2, SSP V4R2, and EP R12 Library Directory (SC31-6259)

This book helps users locate information on a variety of NCP, SSP, and EP tasks. It also provides a high-level understanding of NCP, SSP, and EP and summarizes the changes to these products and to the library for NCP V7R2, SSP V4R2, and EP R12.

NCP V7R2 Migration Guide (SC31-6258)

This book helps users migrate an NCP generation definition from an earlier release to NCP V7R2. It also describes how to add new functions for NCP V7R2.

NCP, SSP, and EP Resource Definition Guide (SC31-6223)

This book helps users understand how to define NCP and EP (in the PEP environment) using SSP. It describes functions and resources and lists the definition statements and keywords that define those functions and resources.

NCP, SSP, and EP Resource Definition Reference (SC31-6224)

This book helps users code definition statements and keywords to define NCP and EP (in the PEP environment) using SSP. It also provides a quick reference of definition statement coding order and keyword syntax.

NCP, SSP, and EP Generation and Loading Guide (SC31-6221)

This book provides detailed explanations of how to generate and load NCP and EP (in the PEP environment) using SSP. It contains information for generating and loading under MVS, VM, and VSE.

NCP and SSP Customization Guide (LY43-0031)

This book helps users who are familiar with the internal logic of NCP and SSP to modify these products. It describes how to change NCP and SSP to support stations that IBM-supplied programs do not support.

NCP and SSP Customization Reference (LY43-0032)

This book supplements the *NCP* and *SSP* Customization Guide. It describes the resources and macroinstructions provided by IBM for customizing NCP and SSP.

NCP, SSP, and EP Messages and Codes (SC31-6222)

This book is a reference book of abend codes issued by NCP and EP in the PEP environment, and messages issued by the system support programs associated with NCP.

NCP, SSP, and EP Diagnosis Guide (LY43-0033)

This book helps users isolate and define problems in NCP and EP (in the PEP environment) using SSP. The primary purpose of the book is to help the user interact with the IBM Support Center to resolve a problem. In addition, it explains some of the diagnostic aids and service aids available with SSP.

NCP, SSP, and EP Diagnosis Aid (LK2T-1999, diskettes)

The Diagnosis Aid is an OS/2 application used to diagnose NCP, SSP, and EP problems. This tool has all the information contained in the NCP, SSP, and EP Diagnosis Guide.

NCP and EP Reference (LY43-0029)

This book describes various aspects of the internal processing of NCP and EP in the PEP environment. It provides information for customization and diagnosis.

NCP and EP Reference Summary and Data Areas (LY43-0030)

This two-volume book provides quick access to often-used diagnostic and debugging information about NCP and EP in the PEP environment.

# Other Networking Systems Products Libraries

The following books provide cross-product information for VTAM, NPSI, NetView, and NPM. For detailed information about these products refer to the library for each.

#### **Networking Systems Library**

The following list shows the books in the Networking Systems library.

Planning for NetView, NCP, and VTAM (SC31-7122)

Planning for Integrated Networks (SC31-7123)

Planning Aids: Pre-Installation Planning Checklist for NetView, NCP, and VTAM (SX75-0092)

IBM Networking Systems Softcopy Collection Kit (CD-ROM, SK2T-6012)

IBM Online Libraries: Softcopy Collection Kit User's Guide (GC28-1700)

#### VTAM Library

The following list shows the books in the VTAM V4R2 library.

VTAM Migration Guide (GC31-6416)

VTAM Release Guide (GC31-6441)

Estimating Storage for VTAM (SK2T-2006)

VTAM Network Implementation Guide (SC31-6419)

VTAM Resource Definition Reference (SC31-6427)

VTAM Resource Definition Samples (SC31-6428, book and diskettes)

VTAM Customization (LY43-0048)

VTAM Operation (SC31-6420)

VTAM Operation Quick Reference (SX75-0201)

Using IBM CommandTree/2 (SC31-7013)

VTAM Messages and Codes (SC31-6418)

VTAM Licensed Program Specifications (GC31-6417)

VTAM Programming (SC31-6421)

VTAM Programming Quick Reference (SX75-0202)

VTAM Programming for LU 6.2 (SC31-6425)

VTAM Diagnosis (LY43-0051)

VTAM Diagnosis Quick Reference (SX75-0203)

VTAM Data Areas for MVS (LY43-0049)

#### **NPSI Library**

The following list shows the books in the NPSI Version 3 library.

X.25 NCP Packet Switching Interface General Information (GC30-3469)

X.25 NCP Packet Switching Interface Planning and Installation (SC30-3470)

X.25 NCP Packet Switching Interface Host Programming (SC30-3502)

X.25 NCP Packet Switching Interface Diagnosis, Customization, and Tuning (LY30-5610)

X.25 NCP Packet Switching Interface Data Areas (LY43-0034)

X.25 NCP Packet Switching Interface Master Index (GC31-6206)

#### **NTune Library**

The following list shows the publications in the NTune library.

NTune User's Guide (SC31-6247)

NTuneNCP Reference (LY43-0035)

#### **NetView Library**

The following list shows the books in the NetView V2R4 library.

NetView General Information (GC31-7098)

Learning about NetView (SK2T-6017, diskettes)

Learning about NetView Graphic Monitor Facility (SK2T-6018, diskettes)

NetView Graphic Monitor Facility Reference Poster (SX75-0100)

NetView Automation Planning (SC31-7083)

NetView Storage Estimates (SK2T-6016, diskette for a PS/2 or a PS/55)

NetView Installation and Administration Guide (SC31-7084 for MVS)

NetView Installation and Administration Facility/2 Guide (or NIAF/2 Guide, SC31-7099)

NetView Administration Reference (SC31-7080)

"Restricted Materials of IBM" Licensed Materials – Property of IBM

NetView Bridge Implementation (SC31-6131)

NetView Tuning Guide (SC31-7079)

NetView Automation Implementation (LY43-0016)

NetView Customization Guide (SC31-7091)

NetView Customization: Writing Command Lists (SC31-7092)

NetView Customization: Using PL/I and C (SC31-7093)

NetView Customization: Using Assembler (SC31-7094)

NetView Operation (SC31-7086)

NetView Graphic Monitor Facility User's Guide (SC31-7089)

NetView Command Quick Reference (SX75-0090)

NetView Messages (SC31-7096)

NetView Resource Alerts Reference (SC31-7097)

NetView Application Programming Guide (SC31-7081)

NetView Resource Object Data Manager Programming Guide (SC31-7095)

*NetView Problem Determination and Diagnosis* (LY43-0101)

### NPM Library

The following list shows the books in the NPM V2 library.

NetView Performance Monitor at a Glance (GH19-6960)

NetView Performance Monitor Concepts and Planning (GH19-6961)

NetView Performance Monitor User's Guide (SH19-6962)

NetView Performance Monitor Messages and Codes (SH19-6966)

NetView Performance Monitor Graphic Subsystem (SH19-6967)

NetView Performance Monitor Installation and Customization (SH19-6964)

NetView Performance Monitor Reports and Record Formats (SH19-6965)

NetView Performance Monitor Diagnosis (LY19-6381)

NetView Performance Monitor Desk/2 User's Guide (SH19-6963)

#### **Related Publications**

The following publications, though not directly related to NCP, may be helpful in understanding your network.

# IBM 3745 Communication Controller Publications

The following list shows selected publications for the IBM 3745 Communication Controller.

IBM 3745 Communication Controller Introduction for the 3745-210, 3745-310, 3745-410, 3745-610 (GA33-0092)

IBM 3745 Communication Controller Introduction for the 3745-130, 3745-150, 3745-170 (GA33-0138)

IBM 3745 Communication Controller Configuration Program (GA33-0093)

IBM 3745 Principles of Operation (SA33-0102)

#### **SNA Publications**

The following publications contain information on SNA.

Systems Network Architecture Concepts and Products (GC30-3072)

Systems Network Architecture Technical Overview (GC30-3073)

Systems Network Architecture Format and Protocol Reference Manual: Management Services (SC30-3346)

Systems Network Architecture Formats (GA27-3136)

## **Communicating Your Comments to IBM**

**Network Control Program Emulation Program** Reference Summary and Data Areas Volume 2

NCP Version 7 Release 2 EP Release 12 Publication No. LY43-0030-01

If you especially like or dislike anything about this book, please use one of the methods listed below to send your comments to IBM. Whichever method you choose, make sure you send your name, address, and telephone number if you would like a reply.

Feel free to comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. However, the comments you send should pertain to only the information in this manual and the way in which the information is presented. To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

If you are mailing a readers' comment form (RCF) from a country other than the United States, you can give the RCF to the local IBM branch office or IBM representative for postage-paid mailing.

- If you prefer to send comments by mail, use the RCF at the back of this book.
- If you prefer to send comments by FAX, use this number:

United States and Canada: 1-800-227-5088

- If you prefer to send comments electronically, use this network ID:

  - IBM Mail Exchange: USIB2HPD at IBMMAILIBMLink: CIBMORCF at RALVM13 – Internet: USIB2HPD@VNET.IBM.COM

Make sure to include the following in your note:

- Title and publication number of this book
- Page number or topic to which your comment applies.
