### SAFETY

#### PERSONAL

The importance of personal safety cannot be over emphasized. To ensure personal safety and the safety of co-workers, follow established safety practices and procedures at all times.

Look for an obey the **DANGER**notices found in the maintenance documentation. All CEs must be familiar with the general safety practices and the procedures for artificial respiration outlines in IBM Form 229-1264. For convenience, this form is duplicated to the right.

#### MACHINE

To protect machines from damage, turn off power before removing or inserting circuit cards of components. Do not leave internal machine areas needlessly exposed, avoid shorting panel pins when scoping, and handle machine parts carefully, in addition, look for and observe the CAUTION notices found in maintenance documentation.

#### 3803-2/3420 XF0005 2735740 See EC 845958 Seg 2 of 2 Part Number History 1 Sep 79

#### **CE SAFETY PRACTICES**

All Customer Engineers are expected to take every safety precaution possible and observe the following safety practices while maintaining IBM equipment:

- 1. You should not work alone under hazardous conditions or around equipment with dangerous voltage. Always advise your manager if you MUST work alone.
- 2. Remove all power, ac and dc, when removing or assem bling major components, working in immediate areas of power supplies, performing mechanical inspection of power supplies, or installing changes in machine circuitry.
- 3. After turning off wall box power switch, lock it in the Off position or tag it with a "Do Not Operate" tag, Form 229-1266. Pull power supply cord whenever possible.
- 4. When it is absolutely necessary to work on equipment having exposed operating mechanical parts or exposed live electrical circuitry anywhere in the machine, observe the following precautions:
- a. Another person familiar with power off controls must be in immediate vicinity.
- b. Do not wear rings, wrist watches, chains, bracelets, or metal cuff links.
- c. Use only insulated pliers and screwdrivers.
- d Keep one hand in pocket.
- e. When using test instruments, be certain that controls are set correctly and that insulated probes of proper capacity are used.
- f. Avoid contacting ground potential (metal floor strips, machine frames, etc.). Use suitable rubber mats, purchased locally if necessary.
- 5. Wear safety glasses when:
- a. Using a hammer to drive pins, riveting, staking, etc.
- b. Power or hand drilling, reaming, grinding, etc.
- c. Using spring hooks, attaching springs.
- d. Soldering, wire cutting, removing steel bands.
- e. Cleaning parts with solvents, sprays, cleaners, chemicals, etc.
- f. Performing any other work that may be hazardous to your eyes. REMEMBER - THEY ARE YOUR EYES.
- 6. Follow special safety instructions when performing specialized tasks, such as handling cathode ray tubes and extremely high voltages. These instructions are outlined in CEMs and the safety portion of the maintenance manuals
- 7. Do not use solvents, chemicals, greases, or oils that have not been approved by IBM.
- 8. Avoid using tools or test equipment that have not been approved by IBM.
- Replace worn or broken tools and test equipment.
- 10. Lift by standing or pushing up with stronger leg muscles this takes strain off back muscles. Do not lift any equipment or parts weighing over 60 pounds.
- 11. After maintenance, restore all safety devices, such as guards, shields, signs, and grounding wires.
- 12. Each Customer Engineer is responsible to be certain that no action on his part renders products unsafe or exposes customer personnel to hazards.
- 13. Place removed machine covers in a safe out-of-the-way place where no one can trip over them.
- 14 Ensure that all machine covers are in place before returning machine to customer
- 15. Always place CE tool kit away from walk areas where no one can trip over it; for example, under desk or table.

2 N 8 8

- 16. Avoid touching moving mechanical parts when lubricating, checking for play, etc.
- 17. When using stroboscope, do not touch ANYTHING it may be moving.
- 18. Avoid wearing loose clothing that may be caught in machinery. Shirt sleeves must be left buttoned or rolled above the elbow.
- 19. Ties must be tucked in shirt or have a tie clasp (preferably nonconductive) approximately 3 inches from end. The chains are not recommended.
- 20. Before starting equipment, make certain fellow CEs and customer personnel are not in a hazardous position.
- 21. Maintain good housekeeping in area of machine while performing and after completing maintenance.

Knowing safety rules is not enough. An unsafe act will inevitably lead to an accident. Use good judgment - eliminate unsafe acts.

#### **ARTIFICIAL RESPIRATION**

#### **General Considerations**

- 1. Start Immediately Seconds Count Do not move victim unless absolutely necessary to remove from danger. Do not wait or look for help or stop to loosen clothing, warm the victim, or apply stimulants.
- 2. Check Mouth for Obstructions Remove foreign objects. Pull tongue forward.
- 3. Loosen Clothing Keep Victim Warm Take care of these items after victim is breathing by himself or when help is available.
- 4. Remain in Position After victim revives, be ready to resume respiration if necessary
- 5. Call a Doctor Have someone summon medical aid.
- 6 Don't Give Up Continue without interruption until victim is breathing without help or is certainly dead.

#### **Rescue Breathing for Adults**

- 1. Place victim on his back immediately.
- 2. Clear throat of water, food, or foreign matter
- 3. Tilt head back to open air passage.
- 4. Lift jaw up to keep tongue out of air passage
- 5. Pinch nostrils to prevent air leakage when you blow.
- 6. Blow until you see chest rise.
- 7. Remove your lips and allow lungs to empty.
- 8. Listen for snoring and gurglings signs of throat obstruction
- 9. Repeat mouth to mouth breathing 10-20 times a minute. Continue rescue breathing until victim breathes for himself.

### MICROPROCESSOR DIAGNOSE, LOOP, AND SCOPING PROCEDURES

This section contains general information that is useful in analyzing the errors covered in Section 16.

# TO DETERMINE THE FAILING INSTRUCTION ADDRESS

The best way to get the failing address is to stop the ALU on the error. To do this, turn the Control Check Switch to the ON position. See **Caution** on this page. Also see stop procedure on 12-010, Seq 3. When the ALU stops, the Instruction Counter contains the address of the *next* (sometimes second) instruction to be executed. Remember that the Instruction Counter and the ROS Register are updated during the execution of the failing instruction.

It is possible that some red light errors are the result of a failure that took place several instructions earlier. For example, bad parity can be stored in an LSR and not be caught until the LSR is read out. This situation results in a B Bus Parity Error, but the real problem exists with the action that loaded the LSR or the LSR itself.

### TO MAKE THE ALU LOOP ON AN ERROR

There are two positions on the ROS Mode switch that can be used to make the ALU loop: the RST/ERR and RST/CMPR.

If the RST/CMPR position is used, the ALU is reset before the instruction at the Compare Register address is executed.

The RST/ERR position gives a better loop in most cases. When the RST/ERR position is used, the instruction executing during the error is completed before the General Reset. It may be necessary to add a jumper from +General Reset Chan AB to +Start NB LTH (CE Start Latch) (B2Q2S10 to A1T2G05) if an I/O operation is included in the loop. The jumper isn't needed if the error occurs during ALU Checkout or Idlescans.

#### GENERAL REFERENCE INFORMATION

The following items should be kept in mind when troubleshooting a microprocessor problem:

- The CE SELECT REG PULSE (COMPARE EQUAL) line (A1U2U07) goes minus just before the execution of the instruction. The Stop On switches must be OFF to allow a compare.
- If the failure is at address 000, RESET OR TRAP ALU2 (A2K2D10, AA011) is a good sync point.
- When displaying ALU execution on the scope, make sure that a complete cycle is shown. The O ns taps for the ALU are:

ALU1 B2F2G12 ALU2 A2K2G12

- BU, BOC, and ADD instructions require a long cycle, 200 ns. All other instructions execute in a short cycle, 150 ns.
- Slow fall time of a pulse might be caused by a missing external load. Check the tape control ALDs for their locations.
- Always remember that you are troubleshooting lines as well as cards. If you find a bad net and the card or cards driving the line have been ruled out, something else must be wrong within the net.
- If an I/O command is involved in troubleshooting a problem offline, a contingent connection might occur. This condition is apparent if ALU1 stops with address 301 in the Instruction Counter. To break the connection, follow each failing command with a sense command.
- Random ALU failures can be caused by the ALU oscillator card, A1C2.
- Use the timing charts for a better understanding of an operation, as well as reference when a timing check is called for. Timing chart is on 16-001.
- If cards are changed and the outputs are still bad with good inputs, check for proper voltages at the card socket.
- The CE Panel lights indicate the ROS data bits, not the ROS Register bits.

Caution: Trapping ALU errors online with the control check switch ON may cause severe impact on customer operations. Make use of the channel retry feature on System/370 CPUs. Place the CPU in hard-stop mode before activating the control check switch. Use the hard-stop mode that ignores recoverable storage errors. When the ALU stops (1) obtain the required information from the CE panel, (2) turn OFF the control check switch, (3) switch the CPU to Process, and (4) start the CPU. This allows the channel retry hardware and software to recover. Recovery is only possible on intermittent ALU errors.

## 16-000

### MICROPROCESSOR CARD INTERCHANGE LIST

The following is a list of cards that can be interchanged between ALUs:

#### ALU1 ALU2

- B2J2 A2G2 (change program jumper 2 as shown on 52-030)
- B2C2 A2N2 B2D2 A2M2

(watch for program jumpers)

- B2E2 A2L2
- B2F2 A2K2

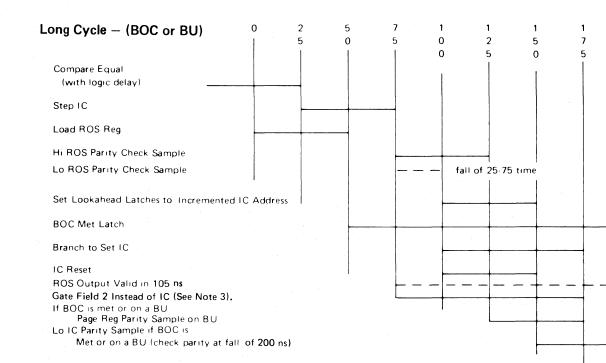

The following is a list of cards that can be interchanged if the two-channel switch feature is installed:

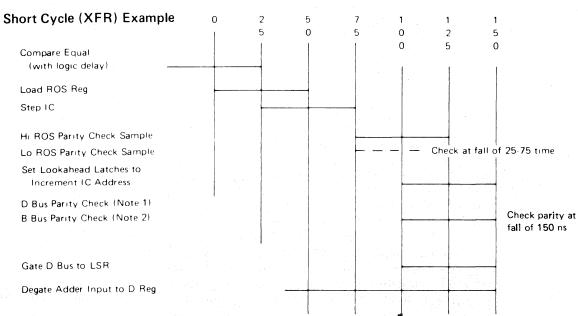

Caution: Removing these cards may cause channel errors, even with power off. Put CPU in single cycle mode before removing cards.

B2Q2	B2P2
B2R2	B2S2

#### Notes:

- 1. Only when data is being taken from Ext. Reg. and is being stored in an LSR.
- 2. Only when data is being transferred from an LSR.
- 3. On a BOC Met or on a BU, the contents of Field 2 are gated to ROS address while the IC is being updated.

### LOW ROS/IC PARITY ERROR ON A BRANCH INSTRUCTION (ALU1)

#### From 13-000 or 14-000

#### ERROR DESCRIPTION:

- Sense Byte 11, Bit 2 is set:
- 1. If incorrect parity is detected in ROS register bits 8 through 15.
- 2. If incorrect parity is detected in instruction counter (IC) bits 8 through 15 while executing a branch unconditional (BU) or branch on condition (BOC) (branch instruction).

Parity is checked at the output of the low order IC (instruction counter) and the low order ROS (read-only storage) register. Even parity sets a hardware error latch and CE panel indicator. Low IC parity is checked on a BU (branch unconditional) or a successful BOC operation. Low ROS parity is checked on every insturction cycle.

The low-order ROS registers in each microprocessor hold the eight low-order bits of the microprogram instruction. The registers in ALU1 and ALU2 are indentical. The output of the registers goes to the 'A' bus, Transfer Decode circuits, or Instruction Counter, depending on the instruction being executed.

#### Most Probable Causes:

- B2H2 (first choice-intermittent failures) Α.
- Β. B2E2 (first choice-solid failures)
- B2L2 (B2M2 w/o EC733814) (second choice-intermittent failures) C.
- A2P4
- D. E. B2F2
- B2D2
- F. G. B2J2

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problems or maintenance calls by going to MAP 00-030.

Seq	Condition / Instruction	Action
1	Is the failure intermittent or accompanied by a high ROS register error?	Change in order: 1. With EC733814, B2L2 Without EC733814, B2M2 2. B2D2
2	Put ALU1 in a loop that includes the failing instruction. See 16-000 for instructions on setting up an ALU loop. 16-000 contains a timing chart and a list of the ALU cards that can be interchanged. Is -IC ROS REG PARITY ERROR (A2P4J10) always plus?	Change A2P4.
3	Does the line in Seq 2 go minus at 75 ns?	Go to Seq 9.
4	Is the failing operation a BU or BOC?	Go to Seq 7.
5	Scope -BOC MET ALU1 (B2E2U04). Is this line minus at any time during the failing instruction?	Change B2D2.
6	If not:	Change B2F2.

Seq	Condition/Instruction	Action
7	Scope -150 NS TAP ALU1 (B2E2B09). Does pulse occur at the correct time?	Change B2E2.
8	If not:	Change B2F2.
9	Is the parity of ROS bits 8-15 and P2 odd at the input to the ROS Register at 50 ns time? See Chart A for pin locations.	Go to Seq 11.
10	If not:	Change B2H2 or B2J2.
11	Is + CLK 1 NOT CE CYCLE ALU1 (B2E2M12) plus from 0 ns-50 ns?	Change B2D2
12	If not:	Change B2F2.

# 16-010

### HIGH ROS/IC REGISTER PARITY/BRANCH CONDITION (ALU1)

From 13-000 or 14-000

#### **ERROR DESCRIPTION:**

Sense Byte 11, Bit 3 is set:

- 1. On every cycle, if ROS data bits 0-7 were not transferred properly to the ROS Register.
- 2. On a Branch Unconditional (BU) or a Branch On Condition (BOC) operation (when the condition is met), the Page Register contents are compared to the ROS Register contents to ensure that the high order address bits were transferred properly.
- 3. On a BOC operation (when the condition is met), a check is made to ensure that only one of the 32 possible conditions is met.

The high-order ROS register in each microprocessor holds the eight high order bits of the microprogram instruction. The registers in ALU1 and ALU2 are identical. Bits 0-3 contain the code and bits 3-7 contain a Branch Condition or Local Storage Register (LSR) address. Bit 3 serves different purposes depending on the instruction being executed.

#### **Most Probable Causes:**

- B2H2 (first choice intermittent failures) Α.
- B2D2 (first choice-solid failures) В.
- С. B2L2, with EC733814
- B2M2, without EC733814
- D. A2P4
- B2F2 Ε.
- F. G. B2D2
- B2J2

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problem or maintenance calls by going to map 00-030.

Seq	Condition / Instruction	Action
1	Put the ALU in a loop that includes the failing instruction. See 16-000 for instructions on scope syncing and ALU looping. 16-001 contains a timing chart and a list of the ALU cards that can be interchanged. Is the failure intermittent or accompanied by a Low ROS/IC Register error?	Change B2D2.
2	Does -INST CARD ERROR ALU1 (A2P4B13) ever go minus?	Go to Seq 4.
3	If not:	Change A2P4. This is a false error.
4	Does -INST CARD ERROR ALU1 (A2P4B13) become minus at 75 ns (125 ns w/o EC733838)?	Go to Seq 6. This is a ROS Register parity error.
5	If not:	Go to Seq 10.
6	Is the parity of ROS bits 0-7 and P1 <b>odd</b> at the input to the ROS Register at 50 ns time? See Chart A for pin locations.	Go to Seq 8.
7	If not:	Change B2H2 or B2J2.

## HIGH ROS/IC REGISTER PARITY BRANCH CONDITION (ALU2)

#### From 13-000 or 14-000

#### ERROR DESCRIPTION:

Sense Byte 12, Bit 3 is set as follows:

- 1. A check is made on every cycle to ensure that ROS data bits 0-7 were transferred properly to the ROS Register.
- On a BU or BOC operation (when the condition is met), IC bits 4 through 7 (Page Register) contents are compared to the ROS Register contents to ensure that the address bits were transferred properly.
- 3. On a BOC operation (when the condition is met), a check is made to ensure that only 1 of the 32 possible conditions were met.

The high-order ROS register in each ALU holds the eight high-order bits of the microprogram instruction. The registers in ALU1 and ALU2 are identical. Bits 0-3 contain the operation code and bits 3-7 contain a branch condition or LSR (Local Storage Register) address. Bit 3 serves different purposes depending on the instruction being executed.

#### Most Probable Causes:

The cards are listed with the highest probability first.

- A. A2K2
- B. A2D2
- C. A2H2 D. A2M2
- E. A2P4
- F. A2G2

**Always** start with Seq 1 and follow the procedure in sequence unless directed otherwise. **Remember** to END all problem or maintenance calls by going to MAP 00-030.

## **D BUS PARITY ERROR (ALU2)**

	From 14-004, 13-001							
ERROR DESCRIPTION:								
Sense Byte 12, Bit 5 is set when even parity is detected on the D bus.								
The D bus parity circuit checks the parity of information to be stored in an LSR (Local Storage Register). Even parity sets Sense Byte 12, Bit 5 and a hardware error latch. This error condition is checked only during transfer of data to the ALU (Arithmetic Logic Unit) from an external source.								
An ALU (Arithmetic Logic Unit) performs all arithmetic and logic operations (AND, OR, exclusive OR, and ADD).								
Most Probable Causes:

## **BRANCH ON CONDITION ERROR (ALU2)**

#### From 13-000 or 14-000

#### **ERROR DESCRIPTION:**

Sense Byte 12, Bit 7 is set when more than one of the branch conditions on the A2D2 card are active at the same time.

#### Most Probable Causes:

- A. A2D2
- B. A2M2
- C. A2P4
- D. A2K2

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problem or maintenance calls by going to MAP 00-030.

Ŀ	Seq	Condition/Instruction	Action
	-	Put the ALU in a loop that includes the failing instruction. See 16-000 for details on scope syncing and ALU looping. 16-001 contains a timing chart and a list of the ALU cards that can be interchanged. Scope +BRANCH ERROR ALU2 (A2P4J04). Is this line a constant minus level?	Change A2P4.
	2	Scope –CLK 17 (A2D2P02). Does this line go plus from 75-125 ns of the failing instruction?	Go to Seq 4.
	3	If not:	Change A2K2.
-	4	Scope the following two pins: -ROS REG 5 ALU2 (A2D2P07) +ROS REG 5 ALU2 (A2D2P11) Are these lines opposite levels?	Go to Seq 6.
	5	If not:	Change A2M2.
	6	Scope the following two pins: -ROS REG 6 ALU2 (A2D2U06) +ROS REG 6 ALU2 (A2D2U11) Are these lines opposite levels?	Change A2D2.
	7	If not:	Change A2M2.

Chart A

De	This chart identifies the correct branch condition for the possible ROS Register contents. Determine the binary value of ROS Register bits 3-7 by using Chart B. Use the binary value to determine which branch condition should be used.

### **ALU2 MICROPROGRAM ERROR**

#### From 14-00X, 13-001

The following MP2 Instruction Counter addresses are programmed traps. When a microprogram error occurs, the microprocessor stops at one of these addresses if the microprocessor is in STOP MODE and the Control Check Stop Switch is ON.

If extended sense data is available, check the FRU code in Sense Byte 23.

Cards A2K2, A2L2, A2M2, A2N2, and B2C2 have duplicates in the other microprocessor. (See 16-250)

The B2C2 card is included because this error can be caused by an undetected ALU failure in MP1.

#### ERROR DESCRIPTION:

Sense Byte 12, Bit 4 is set when the microprogram detects a hardware-type error during ALU (Arithmetic Logic Unit) checkout.

Note: AA361 without EC733838, AA261 with EC733838

## ANALYZING MICROPROGRAM ERRORS

loopi	16-000 for general instructions in analyzing microprocessor errors. 16-000 describes ng and scope syncing techniques. It also contains a list of duplicate cards used in the oprocessors.
	ng the ALU CHECKOUT routine, microprogram errors can be caused by missing or bits in the REGISTER IN, BOC failures, adder failures, and setting high or low LSRs.
	important to know exactly which microprogram instruction is at fault before developing if the CE COMPARE REGISTER is used.
The	following is a list of the conditions that lead to the error:
1	MP1 placed a byte of all ones in XOUTA and trapped MP2 to address 000. Instruction 'NDXTST3,' MP2 branched unconditionally to 'EXECTST3.'
2	MP2 turned on the microprogram error with the XFR HDWERR instruction somewhere in the MP2 checkout.
3	The Instruction Counter is updated by one during the execution of the XFR HDWERR instruction.
4	Enable the CE Panel, disable the interface, turn the Control Check switch on, and turn the ALU1/2 switch to ALU1. Execute a failing type instruction (reset switch or $I/O$ function). If MP1 has any error other than the microprogram error, analyze the other error first.
5	Assuming no MP1 failure, turn the ALU1/2 to the ALU2 position.
6	Again perform the failing type operation. If any other error besides the microprogram error occurs, analyze the other error first.
7	Not all LSRs are cleared before the checkout routine is performed immediately after power on.
8	Rule out a false error by checking pin A2P4J02 for minus level or a pulse. If this pin is a constant plus level, change the A2P4 card.
9	The tables on 16-030 are a list of the conditions that turn on microprogram errors.

### **COMMAND STATUS REJECT**

#### From 14-00X, 00-040

#### ERROR DESCRIPTION:

Sense Byte 10, Bit 0 is set when the tape unit fails to return, or the control unit fails to recognize, the proper command status information to the tape control in response to a command tag and byte. The failing command must be identified by using the sense bytes from LOGREC or OLTs. Sense byte 23 provides the status which the tape control received from the tape unit. (See Chart A on 16-163.)

The first part of this procedure is used to resolve some single tape unit failures. If it is not known which command is failing, test them all by starting at Seq 2 assuming a write-type and then a read-type command. Use Chart C on 16-163 as a guide. Be sure there are no "hot" BUS IN lines along with the correct response for each command.

**Most Probable Causes:** The following is a list of known cards which cause the problems covered in this procedure. The cards are listed with the highest probability first. Lines with multiple cards have the same probability.

**Tape Control** (Multiple Drive Failure) A. A2Q2, B3F2 B. A2D2, A2R2

**Tape Unit 4, 6 8** (Single Drive Failure) A. T-A1M2, T-A1L2, T-A1K2 B. T-A1K6, T-A1J2, T-A1C2

(Single Drive Failure) A. T-A1H2, T-A1L2, T-A1K4 B. T-A1J2, T-A1C2

Tape Unit 3, 5, 7

Interface voltage levels are: + 4.5 V inactive 0 V active

**Always** start with Seq 1 and follow the procedure in sequence unless directed otherwise. **Remember** to END all problem or maintenance calls by going to MAP 00-030. The bits mentioned in this procedure are from Sense Byte 23, FRU list for MP2. (See Chart A on 16-163.)

Seq	Condition/Instruction	Action
1	Does the failure occur on more than one tape unit?	Go to Seq 120.
1A	Is this a Model 3, 5 or 7?	Go to 6A-160.
2	<ul> <li>If the failure is isolated to a single tape unit, it may be diagnosed without the tape control.</li> <li>The failing command may be duplicated by performing the following steps:</li> <li>1. Disconnect the I/O cable from tape unit.</li> <li>2. Reset, load, and ready the failing tape unit with a work tape.</li> <li>3. Ground (D08) the COMMAND tag (T-A1K6D12).</li> <li>4. Ground the appropriate BUS OUT bit (see Chart D on 16-163 for location.)</li> <li>5. Switch tape unit online to allow scoping BUS IN.</li> <li>Charts A, B, and C on 16-163 are used to determine the proper response.</li> </ul>	

Seq	Condition/Instruction	Action
3	Is the failing operation a: Write (01, 0F, 07, LWR)	Go to Seq 4.
	Read (02, 37, 3F, 0C, 27, 2F)	Go to Seq 20.
	Interrupt (Not ready to READY)	Go to Seq 120.
	Interrupt (Set Pulse)	Go to Seq 123.
	Interrupt (SAGC Check)	Go to Seq 140.
	Tach Busy (Writing)	Go to Seq 145.
	Tach Busy (Rewinding)	Go to Seq 157.
	Meter (Writing)	Go to Seq 145.
4	The failure is on a write-type command (01, 1F, 17, or LWR). Ground $-BUS OUT 4 I/O (T-A1K6D06)$ . This forces the tape unit into Write status. If an LWR, also ground $-BUS OUT 2$ (T-A1K6B04). After putting on test jumpers, ground $-BUS OUT 6$ (T-A1K6D07) momentarily.	
5	Are any of the following lines at the level indicated? +CONTROL TAG (T-A1K6D10) plus? -COMMAND TAG (T-A1K6D09) plus? -MOVE TAG (T-A1K6B12) minus?	Change T-A1K6.
6	Is -BUS IN 0 (T-A1L2D02) minus?	Go to Seq 34.
7	Is -BUS IN 1 (T-A1L2D04) minus?	Go to Seq 47.
8	Is failing command an LWR (hex 8B)?	Go to Seq 68.
9	Is -BUS IN 2 (T-A1L2D05) minus?	Go to Seq 57.
10	Is -BUS IN 3 (T-A1L2D06) minus?	Go to Seq 75.
11	Note: Bus In 4 (Byte 23, Bit 4) should be ON for a write-type command. Example: 01, 1F, or 17. Is -BUS IN 4 (T-A1L2D07) minus?	This is a normal response to a Write Command. Go to Seq 16.
12	Is +STATUS BUS 4A (T-A1L2P12) plus?	Change T-A1L2.
13	Is -WRITE STATUS (T-A1M2U04) plus?	Go to Seq 40.
14	Is +STATUS BUS 4 (T-A1M2J09) minus?	Change T-A1M2.
15	If not:	Change T-A1K2.
16	Is –BUS IN 5 (T-A1L2D09) minus?	Go to Seq 83.
17	Is -BUS IN 6 (T-A1L2D10) minus?	Go to Seq 89.
18	Is -BUS IN 7 (T-A1L2D11) minus?	Go to Seq 104.

19	lf not:	This is a normal BUS IN 4 response to a write-type command. Turn power off, remove test jumpers, and check with a meter:
		Y1D06, N4B06 to K6D06 Y1B12, N4B12 to K6D12 L2D07, N2B06 to Y1J06
		If LWR, this is a normal BUS IN 2 response. Check with a meter:
		Y1D04, N4B04 to K6B04 (B02) L2D05, N2B04 to Y1J04 (B12) Go to Seq 118.
20	Ground –BUS OUT 1 I/O (T-A1K6B03). This forces the tape unit into Forward Read status. After installing the test jumper, ground –BUS OUT 6 (T-A1K6D07) momentarily.	
21	Is -BUS IN 0 (T-A1L2D02) minus?	Go to Seq 107.
22	Is -BUS IN 1 (T-A1L2D04) minus?	Go to Seq 47.
23	Is -BUS IN 2 (T-A1L2D05) minus?	Go to Seq 57
24	Is -BUS IN 3 (T-A1L2D06) minus?	Go to Seq 75.
25	Is -BUS IN 4 (T-A1L2D07) minus?	Go to Seq 113.
26	Is -BUS IN 5 (T-A1L2D09) minus?	Go to Seq 83.
27	Is -BUS IN 6 (T-A1L2D10) minus?	Go to Seq 89.
28	Is -BUS IN 7 (T-A1L2D11) minus?	Go to Seq 104.
29	Remove jumper from T-A1K6B03 and put on T-A1K6B02. This forces backward status. BUS IN 0 is normal response to Read Backward commands (i.e., 0C, 27, 2F). Is -BUS IN 0 (T-A1L2D02) minus?	Turn power off and check continuity: Y1D02, N4B02 to K6B02 Y1B03, N4D03 to K6B03 L2D02, N2B02 to Y1J02 Go to Seq 118.
30	Is -BUS OUT 0 (T-A1J2D11) plus?	Change T-A1K6.
31	Is +BKWD STATUS (T-A1J2P11) minus?	Change T-A1J2.
32	Is +STATUS BUS 0 (T-A1M2B05) minus?	Change T-A1M2.
33	If not:	Change T-A1L2.
34	Is +BKWD STATUS (T-A1M2G04) plus?	Go to Seq 38.
35	Is +STATUS BUS 0 (T-A1M2B05) plus?	Change T-A1M2.
36	Is -BUS IN 0 (T-A1L2D02) minus?	Change T-A1L2.
37	If not:	Recheck at Seq 6.
38	Is -WRT STATUS (T-A1J2M12) plus?	Go to Seq 40.
39	If not:	Remove test jumper and change T-A1J2

2002 2/2420

- 1. This command is sent to a tape unit after a Rewind/Unload is initiated or if a Start I/O is issued to a Not Ready tape unit in which the Interrupt In line is not previously pulsing. To test statically, enter a Rewind/Unload command (hex 0F). If a Rewind/Unload is executed and ROS is set to Stop, the tape unit will execute the operation.
- 2. On Set Pulse commands, the tape control samples the tape unit Interrupt In line instead of Bus In. Refer to ALD FT131. Ensure the Interrupt In line has a symmetrical square wave approximately 500 ns wide.
- This command is issued only on Read Backward or Backspace 3. Block commands in 6250 mode.
- 4. If this command is suspected as failure, do a Compare Equal on ALU2 address 775.
- 5. The TC does not require any response from the tape unit for a Reset command and, therefore, no Command Status Reject can be set.
- 6. If active, troubleshoot tape unit first on tape unit logic FT114.
- 7. Interchange tape unit signal cable to another TU if possible. If there is a path failure (same address fails), go to 18-000 for Selection (1x8) logic or go to 18-010 for Device Switch feature.

#### Chart A

#### Chart C

	e following meaning:
	TU failed to set forward status.
	Gap control is active in TU.
FRU Bit 2 On:	TU is in diagnostic mode and Reset command was ineffective. (Normal response to LWR.)
FRU Bit 3 On:	Opposite direction—should not be on.
FRU Bit 4 On:	Normal response to Write command.
	Possible—will not cause error.
	Unit Check condition in TU or Reset command was ineffective.
	Unused—Active BUS IN bit at command time.
	I failed to respond or failed to recognize BUS OUT bit 4.
FRU≠00:	Possible that the TU failed to recognize command tag.
When this bit is set v (byte 23) has the follo	vith a read-type channel command word, the ALU2 FRU ID sense byte bwing meaning:
	Normal response to set read backward. TU is in backward status. Gap control is active.
FRU Bit 2 On:	TU is in diagnostic mode and Reset command was ineffective.
FRU Bit 3 On:	Opposite direction—should not be on.
FRU Bit 4 On:	TU failed to reset write status.
	Possible—will not cause error.
	Unit Check condition in TU or Reset command was ineffective.
	Unused—Active Bus In bit at command time.
FRU=00:	Normal response to Set Read Forward command.
FRU≠00:	Possible that the TU failed to recognize the command tag.

#### Chart B: Tape Unit Commands and Command Status Byte

Bit	Command Bus Out	Status Byte Bus In
0	Set backward read.	Normal response to backward read.
1	Set forward read.	Gap control is hot.
2	Set diagnostic (LWR).	TU is in diagnostic mode.
3	Set pulse.	Opposite direction (hot Bus In at command time).
4	Set write.	Write status (normal response to a Write command).
5	Set extended stop.	Extended stop (hot Bus In at command time).
6	Reset tape unit.	Unit check (unit check not being reset in tape unit).
7	Unused.	Positioning.

## PE OR NRZI AND GCR VELOCITY CHECKS/CHANGES

From	14-000
------	--------

**ERROR DESCRIPTION:** 

#### PE OR NRZI

#### Velocity Check (Sense Byte 10, Bit 7)

a'

The tape control does not check the first four tach pulses after GAP CONTROL becomes active. If the tape control counts 24 tach pulses without finding four consecutive tach pulses within specifications, Velocity Check is set.

#### Velocity Change During Write (Sense Byte 9, Bit 1)

Velocity is checked on PE records of more than 220 bytes and NRZI records of more than 120 bytes. If any tach pulse is out of specification, Velocity Change During Write is set.

#### GCR (6250)

#### Velocity Check (Sense Byte 10, Bit 7)

The tape control does not check the first tach pulse after GAP CONTROL becomes active. If the tape control counts 32 half tach pulses without finding one full tach pulse in specification, Velocity Check is set.

#### Velocity Change During Write (Sense Byte 9, Bit 1)

Velocity is checked on 6250 bpi records or more than 824 bytes. If any tach pulse is out of specification, Velocity Change During Write is set.

#### Most Probable Causes:

Con	trol Unit	Single Tape Unit
Α.	Y1C2	A. Low Air Bearing Pressure
В.	A2D2	B. Tape Sticking
C.	A2E2	C. Loose Stubby Bar

# 16-196

### **DYNAMIC REVERSAL**

#### From 14-000

#### ERROR DESCRIPTION(Sense byte 10, Bit 4):

This bit is set when the turnaround counter overflows before the tape direction is reversed during a dynamic reversal of direction. A dynamic reversal takes place only when changing from read to write status and when changing from backward to forward direction. This bit is set when the beginning-of-tape (BOT) marker isn't found in the specified time after the tape control recognizes the SAGC burst during a read backward operation.

Most	Probable Cause:
А. В. С.	A2D2 Y1P2 (Y1 location, see 19-001) A2E2

**Always** start with Seq 1 and follow the procedure in sequence unless otherwise directed. **Remember** to END all problem or maintenance calls by going to MAP 00-030.

Seq	Condition/Instruction	Action
1.	Failure on more than one tape unit?	Change A2D2, Y1P2, A2E2.
2	This is a tape unit motion problem?	Go to 6B-000.
3	If not:	Recheck symptoms.

## **CONTROL STATUS REJECT**

From 14-000 or 00-040		ays start with Seq 1 and follow the procedu ember to END all problem or maintenance of	
ERROR DESCRIPTION: (Sense Byte 10, Bit 2)		<u> </u>	Γ
Sense Byte 10, Bit 2 is set when the tape unit fails to return the proper control status information to the tape control in response to a control tag and byte.	Seq	Condition/Instruction	Action
It is possible to get a CONTROL STATUS REJECT on a non-control command (Example: a write command). If you have this indication, try all control commands first.	1	Does failure occur on more than one tape unit?	Go to Seq 89.
When this bit is set, FRU ID sense byte 23 has the following meaning.	1A	Is this a Model 3, 5, or 7 tape unit?	Go to 6A-160.
FRU Bit 0 On: Normal response to Rewind Unload command.FRU Bit 1 On: SpareFRU Bit 2 On: High sense level PE - 120%.FRU Bit 3 On: Normal response to Set Alternate Density Command.FRU Bit 4 On: Low sense level PE - 80%.FRU Bit 5 On: Normal response to DSE command.FRU Bit 6 On: Normal response to Set Erase command.FRU Bit 7 On: Normal response to Rewind command.FRU=00Possible that the tape unit failed to recognize a control tag.FRU/00FRU=12Valid response to Set SAGC on 6250 Write from Load Point.Any other multi-bit response, excluding bit 2 or 4, is invalid.	2	<ul> <li>In order to analyze the problem offline, the OLTs or LOGREC must be used to determine the failing command. When this error occurs, Sense Byte 23 contains the response byte from the tape unit. Perform the following steps to duplicate the failing command and allow scoping in a static condition: <ol> <li>Take tape unit offline and unload.</li> <li>Disconnect I/O cable.</li> <li>Switch tape unit online to allow scoping Bus In.</li> <li>Reload and make tape unit Ready.</li> <li>Ground – Control Tag I/O (T-A1K6D11) and the appropriate Bus</li> </ol> </li> </ul>	
ried one at a time using Charts A through E on 16-213 as a guide. Be sure there are no not bits on lines along with the correct response for each command. If you have finished checking the CONTROL TAG responses without finding the error, go to 16-160 and check the COMMAND TAG responses.		Out pin (See Charts A and F, 16-213) Sense Byte 23 contains information to analyze this error. Are any of the following lines at the level indicated below?	Change T-A1K6.
Most Probable Cause: The following is a list of the cards which can cause the problems covered in this procedure. The cards are listed with the highest probability first. Lines with multiple cards have the		+Control Tag (T-A1K6D10) minus? -Command Tag (T-A1K6D09) minus? -Move Tag (T-A1K6B12) minus?	
same probability. Tape Control Cards: (multiple tape unit failures) A. A1H2, A2R2 B. Y1Q2	4	Use Charts B, C, and D on 16-213 to determine starting sequence. Use Charts E and F to determine correct response.	
Tape Unit Cards: (single tape unit failures)         Models 4, 6, 8         A. T-A1M2       D. T-A1J2         G. Read Card         B. T-A1L2       E. T-A1K2         C. T-A1K6       F. T-A1C2	5	Note: BUS IN 0 (Sense Byte 23, Bit 0) is normal response to a Rewind/Unload command. Is +Rwd Unload (T-A1M2D13) plus?	Go to Seq 9.
Models 3, 5, 7	6	Is +Status Bus 0 (T-A1M2B05) plus?	Change T-A1M2.
A. T-A1H2 B. T-A1L2	7	Is –Bus In 0 (T-A1L2D02) minus?	Change T-A1L2.
C. T-A1K4 D. T-A1J2	8	If not:	Remove test jumpers.
E. T-A1C2 Tape Control Unit: (Additional Cards Referenced)	9	Is +Set Rwd Unld Command (T-A1C2D06) minus?	Change T-A1C2.
A. A2N2 B. A2E2	10	Is -Bus Out 0 (T-A1J2D11) minus?	Change T-A1K6.
C. Y1D2 D. A2D2 E. A2T2	11	If not:	Recheck symptoms. Go to ALD pages t resolve.
Notes:	12	Ground +Tape Present (T-A1C2S08).	
<ol> <li>An MST line -0.85/-1.85 Vdc that is approximately at v-ref level (approx1.3 Vdc) is not terminated. This line is terminated on T-A1J2.</li> </ol>	13	Is -Bus Out 0 (T-A1J2D11) plus? See Note 1.	Change T-A1K6.

Seq	Condition/Instruction	Action
15	Is +Status Bus 0 (T-A1M2B05) minus?	Change T-A1M2.
16	Is -Bus In 0 (T-A1L2D02) plus? See Note 2.	Change T-A1L2.
17	If not:	Turn power off. Remove test jumpers and check continuity with a meter from T-A1: L2D02 to N2B02 and tailgate Y1J02, then K6B02 to N4B02 and tailgate Y1D02.
18	Note: Bus In 1 (Byte 23, Bit 1) is unused on a control command. Is +Status Bus 1 (T-A1M2B07) plus?	Change T-A1M2.
19	Is –Bus In 1 (T-A1L2D04) minus?	Change T-A1L2.
20	lf not:	Remove test jumpers. Recheck symptoms. Go to ALD pages to resolve
21	This bit is not used with Control Tag.	Recheck your symptoms.
22	Note: Bus In 2 Bit (Byte 23, Bit 2) is normal response to a Set High Sense PE. 120% Is +Status Bus 2 (T-A1M2G10) plus?	Change T-A1M2.
23	ls –Bus Out 2 (T-A1K2G10) minus?	Change T-A1K6.
24	ls +Status Bus 2A (T-A1K2D06) plus?	Change T-A1K2.
25	ls –Bus In 2 (T-A1L2D05) minus?	Change T-A1L2.
26	If not:	Remove test jumpers. Recheck symptoms. Go to ALD pages to resolve

### P COMPARE OR C COMPARE ERRORS

#### From 14-000, 17-510, 17-590

#### **ERROR CONDITIONS:**

Sense Byte 3, Bit 7 is set by P Check Channel Buffer, Write Data Parity Error, Buffer Error, CRC Set P Compare error or C Compare error.

- A. P Check Channel Buffer is set when parity of the byte sent to the Channel Buffer is even.
- B. Write Data Parity error is set when there is no match between Channel Buffer Out P and Write Bit P which is encoded and written on tape.
- C. Buffer error is set by Buffer Overrun or Write Address error, or if Service Response count does not equal Channel Read Out Counter (CROC) after all data has been read from the Channel Buffer.
  - 1. Buffer Overrun is set when the Write Group Buffer is empty while more data is read out.
  - 2. Write Address Error is set when Channel Read in Counter (CRIC) is even and Service Response pulses are odd, or CRIC is odd and Service Response pulses are even.
- D. CRC Set P compare error is set when CRC-A does not match CRC-B. CRC-A is a CRC character generated from accumulated data in the channel buffer. CRC-B is a CRC character generated from accumulated data from the Read register.
- E. C Compare error is set only when operating in 7-track data convert mode.
  Read: C Compare is set when combined data P does not match read data track P.
  Write: C Compare is set when Channel Buffer Out P does not match Write Bus P.
  C Compare checks that correct parity (odd or even) is maintained by the tape control while processing 7-track NRZI data. C compare is set under the following conditions:
  - 1. Translator off and Data Converter off: If parity of an individual byte changes within the tape control while reading or writing.
  - 2. Data Converter on and Translator off:
  - a. During 7-track read operations, if the parity of a group of 4 BCD characters changes within the tape control.
  - b. During 7-track write operations, if the parity of a group of 3 EBCDIC bytes changes within the tape control.
  - 3. Translator on and Data Converter off: During 7-track operations with translator on and data converter off, C Compare is always off.
- F. Bus Out Parity Error can cause C Compare.
- G. Data converter check blocks C compare if the DCC occurs first.

#### MOST PROBABLE CAUSE:

#### **P OR C COMPARE**

Sense byte 3, bit 7 is set by P Check Buffer, Write Data Parity Error, Buffer Error, CRC Set P Compare Error, or C Compare Error.

- A. P Check Channel Buffer is set when parity of the byte sent to channel is even.
- Write Data Parity Error is set when there is not compare between Channel Buffer Out P and Write Β. Bit P, which is encoded and written on tape.
- C. Buffer Error is set by a buffer overrun, a write address error, or if the service response count does not equal Channel Read-Out Counter (CROC), after all data has been read out of the channel buffer.
  - 1. Buffer overrun is set when the write group buffer is empty while more data is read out.
  - 2. Write address erroris set when Channel Read In Counter (CRIC) is even and service response pulses are odd, or CRIC is odd and service response pulses are even.
- D. CRC Set P Compare Error is set when CRC-A does not match CRC-B. CRC-A is a CRC character generated from accumulated data in the channel buffer. CRC-B is a CRC character generated from accumulated data from the read register.
- E. C Compare is set only when operating in 7-track data convert mode.
  - 1. Read: C Compare is set when combined data P does not match read data track P.
  - 2. Write: C Compare is setwhen Channel Buffer Out P doesnot match Write Bus P.
- F. Bus Out Parity Error can cause C Compare. An attempt to correct more than one track can cause C Compare.

## WRITE TRIGGER VERTICAL REDUNDANCY CHECK (VRC) ERROR

#### From 14-000

#### **ERROR DESCRIPTION:**

Sense Byte 4, Bit 3 is set when data sent to the tape unit has incorrect parity.

- A. In 6250 bpi mode Parity is checked on the total number of one bits in a 6250 bpi encoded group. Even parity is used for a data group and A2 format group or any combinations using the A2 format group, odd parity for all other groups.
- In PE mode Parity is even at Write clock 3 (WC3) and odd at Write clock 11 Β. (WC11).
- In 9-track NRZI mode Parity is even before the first byte is written. After the first С. byte, parity then alternates between odd and even.
- In 7-track NRZI mode if even parity is written, parity remains even. If odd parity is D. written, parity alternates between odd and even after the first byte is written.

#### Most Probable Causes:

The following list of cards can cause the problems covered The cards are listed with the highest probability first. Lines with multiple cards have the same probability. Cards separated by slashes are interchangeable.

A. B. C. E. F. <b>ADD</b> A. B. C. D.	A1G2 A1T2 A1T2 Y1J2 A1H2 Y1H2, Y1K2/Y1L2/Y1M2 A1K2, A1L2, Y1C2, Y1G2, Y1N2, Y1P2 VITIONAL CARDS AFFECTED: Y1S2 A1E2 A2Q2 A1F2								
Rem	Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. <b>Remember</b> to END all problems or maintenance calls by going to MAP 00-030. <b>Refer to 17-022 through 17-025 for timing charts and to 17-021 for test points</b> .								
Seq	Condition/Instruction	Action							
1	From the CE panel, use a LWR 8B command with gaps (jumper A1S2G08 to ground), or Write 01 command to write all ones in the failing mode. For 6250 bpi, move tape away from load point. Use byte count of 0B0 hex.								
2	Sync the scope negative on -WRT CONDITION (A1G2G07).								
3	Is sync pulse bad? (See 17-022.)	Go to ALD BW151 GF6 and follow line back to failing point.							
4	Is tape unit operating in 7- or 9-track NRZI mode?	Go to Seq 45.							
5	Scope all the +TUBOs (see test point charts on 17-021 and timing charts on 17-025). Check all of the record. Is one or more TUBO bad? (See 17-021.)	Go to Seq 8.

#### WRITE TRIGGER VRC

Sense byte 4, bit 3 is set:

- A. 6250 Write parity is checked on the total number of one bits in a 6250 encoded group (five 9-bit bytes). Even parity is used for a data group and A2 fromat group or any combinations using the A2 format group, odd parity is used all other groups.
- B. PE Mode parity is even at WC3 and odd at WC11.
- C. Nine-track NRZI parity is not checked until the first byte is written (-XOUTA BIT 1 ALU1 to DF; 'ALLOW EOD'). After the first byte is written, parity then alternates between odd and even.
- D. Seven-track NRZI if even parity is written, parity remains even. If odd parity is written, parity alternates between odd and even after +Wrt Trg VRC D10 A1G2 the first byte is written.

Odd-even FF is pre-set to its active state.

## 17-081

### EARLY BEGIN READBACK CHECK

#### From 14-000

#### ERROR DESCRIPTION:

Sense Byte 8, Bit 3 is set when beginning of block (BOB) is active too soon during a Write or Write Tape Mark operation, or the interval

from writing the last zero until interblock gap (IBG) is sensed (TU FAST) is too short. In 1600 bpi mode, Sense Byte 8, Bit 3 sets Data Check. In 6250 bpi Write mode, Sense Byte 8, Bit 3 sets Equipment Check.

#### Most Probable Causes:

The following list of cards can cause the problems covered in this MAP. The cards are listed with the highest probability first. Lines with multiple cards have the same probability. Cards separated by slashes are interchangeable.

Control Unit

Y1P2

Α.

В.

- Single Tape Unit A. Air leak Y1T2/S2/R2 B. Erase head Y1D2, Y1H2 C. Magnetized read head
- C. D. Y1C2, A2D2

#### ADDITIONAL CARDS AFFECTED

- Α. A2D2
- Y1Q2 Β.

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problems or maintenance calls by going to MAP 00-030.

Seq	Condition/Instruction	Action
1	Is this a single tape unit failure? For Models (4, 6, 8), go to 5B-000. For Models (3, 5, 7), go to 5A-000.

## MTE WITHOUT ENVELOPE CHECK

#### From 14-000

#### ERROR DESCRIPTION:

Sense Byte 3, Bit 1 is set:

- 1. During a 6250 bpi Write operation at the end of data (EOD) time, if two or more tracks have required correction, or if hardware pointers have been set in two or more tracks between resync bursts and no time sensors have dropped.
- 2. During a 6250 bpi Read operation at the end of data (EOD) time, if more than two tracks have required correction.
- During a PE Read operation, if hardware pointers have been set (Phase Errors occurred) in two or more tracks and a vertical redundancy check (VRC) error occurred.

Note: If any tracks dropped below an acceptable amplitude level, Envelope Error (Sense Byte 3, Bit 4) would also be set.

#### Most Probable Cause:

The following list of cards can cause the problems covered in this procedure. The cards are listed with the highest probability first. Lines with multiple cards have the same probability. A. Y1J2

#### B. A1K2, Y1D2, Y1F2, Y1G2, Y1H2

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problems or maintenance calls by going to MAP 00-030.

Seq	Condition/Instruction	Action
1	Write all ones data in the failing mode. Use the LWR command if the tape unit fails with this command, otherwise use the Write command. Write 14 byte, 0B0 (Hex), records in 6250 bpi mode or eight byte records in PE mode.	
2	If the tape unit is failing on a Write operation, continue following this procedure. If it is failing on a Read operation, read the prewritten tape and proceed.	
3	Sync the scope positive on -IBG (Y1P2M07).	
4	Is +MTE OR LRCR ERROR (A1K2S02) always minus?	Change A1K2.
5	Is the tape unit failing in NRZI mode? (See the Mode Chart on this page.)	Go to 17-310.
6	Is the unit failing on a Write operation (Byte 1, Bit 5 ON)?	Go to Seq 15.
7	Is the unit failing in PE mode? (See the Mode Chart on this page.)	Go to Seq 15.
8	Is -PE MODE (Y1J2J05) minus?	Go to ALD BW231GJ6 and follow line back to failing card.
9	Does -RDD169 (Y1D2J07) ever go minus?	Go to ALD CN221CG6 and follow line back to failing card.
10	Is +WRITE AND TAPE OP (Y1J2M11) minus?	Go to ALD BW231GF2 and follow line back to failing card.
11	Is -MTE WRT SAMPLE (Y1J2P03) bad? (See timing chart on 17-111.)	Go to ALD CH131 and follow line back to failing card.

## SKEW - RIC EQUALS ROC

#### From 14-000, 14-012, 17-070, 17-700

#### ERROR DESCRIPTION:

Sense Byte 3, Bit 2 is set when excessive skew (any RIC is equal to the ROC) is detected during a PE Write, PE Read or Read Backward, 6250 bpi Read or Write or a NRZI Write operation.

- Α. For a PE Write operation, this sense bit is set if the RIC (Read In Counter) exceeds the ROC (Read Out Counter) by 4 counts on any track.
- B For a PE Read or Read Backward operation, this sense bit is not set under normal conditions. ALMOST SKEW is recognized when RIC is greater than ROC by 14 counts. This condition sets the dead track register which does not recognize RIC for that track and allows ROC to cycle. If the dead track register recognizes RIC or is not set, Skew Error is then set when RIC is greater than ROC by a 30-count difference.
- С. For a 6250 bpi Write operation, this sense bit is set if there is no envelope before the residual frame time.
- D. For a 6250 bpi Read operation, this sense bit is not set under normal conditions. ALMOST SKEW is recognized when RIC is greater than ROC by 26 counts. This conditions sets the dead track register which does not recognize RIC for that track and allows ROC to cycle. If the dead track register recognizes RIC or is not set, Skew Error is then set when RIC is greater than ROC by a 30-count difference.
- NRZI skew is the time lapse between the receipt of the first and the last bit of a data Ε. byte. For a NRZI Write operation, this sense bit is set when a set first bit comes after 9 time (about 28% of the total bit period time elapsed).

#### Most Probable Causes:

The following list is of the known cards which can cause the problems covered in this procedure. The cards are listed with the highest probability first. Lines with multiple cards have the same probability. Cards separated by slashes are interchangeable.

	Condition/Instruction	A
	Condition/Instruction	Action
_	Does the tape control fail in a 6250 bpi write operation? (Check sense bytes 6 and 1.)	Go to Seq 37.
	Do a Read or LWR (with gaps, count 0B0, write data FF0) in the failing mode (PE or 6250). LWR should be used if it fails.	
	Sync the scope minus on -BOR (Y1P2J13). Does the scope fail to sync? Set time base to display the complete record.	Go to ALD CC001 GM6 and follow line to point of failure.
	Is +SOME TRACK MARG ZN 1 (DOT OR) (Y1M2S02) plus during sync time (-BOR)?	Go to Seq 26.
	Is +EXCESSIVE SKEW (DOT OR) (Y1M2P13) minus all the time?	Change A1K2.
	Is -WRITE AND TAPE OP minus all the time?	Go to ALD BW231 GF6 and follow Y1N2J09 line back to point of failure.
	If not:	Change in order: 1. Y1M2/L2/K2 2. Y1N2 3. Y1C2
	Are any +DEAD TRACK REGISTERS set after the +SOME TRACK MARG ZN 1 (DOT OR) (Y1M2S02) becomes plus? See test point chart on 17-162.	Go to Seq 31.
	Does -SKEW ERROR (A1K2P11) become active before -ROC CYCLED (Y1G2P11) is minus?	Go to Seq 33.
	Is the -POINTER BUS and +ALMOST SKEW lines active at the same time for the failing tracks? See test point chart on 17-162.	Change Y1P2.
	Is -Gated PGM SYNC (Y1G2M11) good? See 6250 or timing chart on 17-163 or PE write timing chart on 17-165, depending on the mode of operation.	Change Y1P2.
	If not:	Go to ALD CC121 BM6 and follow line to point of failure.
	Check the $-NO$ COMP lines. Is one of the zones coming up late? See test point chart on 17-162, and the PE timing chart on 17-165 or 6250 timing chart on 17-163, depending on mode of operation.	Change card for late zone. Zone 1 - Y1M2 Zone 2 - Y1L2 Zone 3 - Y1K2
	If not:	Go to Seq 28.
	Are more than two +PE WRITE SKEW lines plus? See test point chart on 17-162.	Go to Seq 28.
	Are all the +PE WRT SKEW lines plus all the time? See test point chart on 17-162.	Change Y1M2.

## SKEW RIC EQUALS ROC (Cont'd

Seq	Condition/Instruction	Action
35	Is thePOINTER BUS minus at the time of the error for the failing track? See test point chart on 17-162.	Change Y1P2.
36	If not:	Go to Seq 29
37	Do a Write or LWR (with gaps, count OBO, write data FFO) in 6250 mode. Sync the scope minus on -WRITE CONDITION (A1G2G07) 20 microseconds per division. When doing a 6250 LWR, tape must be away from load point.	
38	Are the –PE lines (Y1Q2P05, Y1Q2M05, and Y1Q2M04) all plus?	Go to Seq 40.
39	If not:	Change Y1Q2.
40	Are the -6250 lines (Y1Q2M07, Y1Q2P06, and Y1Q2P04) all minus?	Go to Seq 42.
41	If not:	Change Y1Q2.
42	Is +6250 WRT SKEW (DOT OR) (Y1M2M04) solid plus during the entire record?	Change in order: 1. Y1M2 2. Y1K2 3. Y1L2
43	Do all the -VFC DATA lines pulse? See test point chart on 17-162.	Go to Seq 48.
44	Check the – DEVICE BUS IN to DF lines for the failing tracks. Are they good? See 6250 timing chart on 17-163, and test point chart on 17-162.	Go to Seq 62.
45	Compare the $-BUS$ IN lines from the tape unit to the $-DEVICE$ BUS IN TO DF timing charts. Are they the same? See 6250 timing chart on 17-162.	Change in order: 1. Y1C2 2. A2D2
46	Does the tape control have the device switch feature?	Change in order: 1. Y1C2 2. A2D2
47	If not:	Go to 18-010.
48	Do all the -VFC PRIME DATA lines pulse? See test point chart on 17-162.	Go to Seq 50.
49	Change cards for bad zone group.	Zone 1 - Y1T2 Zone 2 - Y1S2 Zone 3 - Y1R2

Seq	Condition/Instruction	Action
50	Check +RIC RESET lines for all tracks. Are any bad? See timing chart on 17-165 and test point chart on 17-162.	Go to Seq 84.
51	Compare the $-NO$ COMP lines for each zone to the $+6250$ WRT SKEW (DOT OR) (Y1L2M04). See test point chart on 17-162.	
52	Are the -NO COMP lines minus at the time +6250 WRT SKEW (DOT OR) (Y1L2M04) goes plus?	Go to Seq 55.
53	Check +STEP RIC for all tracks of the failing zone. Do they pulse? See test point chart on 17-162.	Go to Seq 81.
54	If not:	Change the bad zone:
		Zone 1 - Y1T2 Zone 2 - Y1S2 Zone 3 - Y1R2
55	Is +GB FULL (Y1N2G08) bad? See 6250 timing chart on 17-164 or timing chart on 17-165, depending on mode.	Change Y1N2.
56	Is +ECC GROUP FULL (Y1J2U07) bad? See 6250 timing chart on 17-164 or PE timing chart on 17-165, depending on mode.	Change Y1J2.
57	Is -TAPE OP (Y1P2M03) plus?	Change A1K2.
58	Is +A+B 3 25-75 (Y1N2J04) at a solid level?	Change Y1J2.
59	Does –WRITE OSCILLATOR (Y1P2U12) pulse during the first part of the preamble?	Go to Seq 81.
60	Does – CLOCK SYNC FREQUENCY OSC (Y1P2U07) pulse?	Change Y1P2
61	If not:	Change A1K2.
62	Are all -VFC DATA lines failing to pulse? See test point chart on 17-162.	Go to Seq 66.
63	If not:	Change the failing zone: Zone 1 - Y1T2 Zone 2 - Y1S2 Zone 3 - Y1R2
64	Does +LOW GAIN (Y1P2U12) go plus during the preamble and stay plus through the postamble?	Change A2Q2.
65	If not:	Go to Seq 90.
66	Does -WRITE OSCILLATOR (Y1Q2B10) pulse?	Go to Seq 68.
67	If not:	Change A2Q2.

Seq	Condition/Instruction	Action
68	Are the -RECORD TRACK X lines for all tracks the same? See test point chart on 17-162.	Change the failing zone: Zone 1 - Y1T2 Zone 2 - Y1S2 Zone 3 - Y1R2
69	lf not:	Change in order: 1. Y1P2 2. Y1Q2
70	Do a Write or LWR (byte count 0B0, data FF0, with gaps) in PE mode. Sync the scope minus on -WRITE CONDITION (A1G2G07) 50 microseconds per division. Use LWR if it will fail.	
71	Are the –6250 lines (Υ1Q2M07, Υ1Q2P06, and Υ1Q2P04) (all three) plus?	Go to Seq 73.
72	If not:	Change Y1Q2.
73	Are the –PE lines (Y1Q2P05, Y1Q2M05, and Y1Q2M04) (all three) minus?	Go to Seq 75.
74	If not:	Change Y1Q2.
75	Is +PE WRT SKEW (DOT OR) (Y1M2P06) plus all the time?	Change in order: 1. Y1M2 2. Y1L2 3. Y1K2
76	Check the -VFC PRIME DATA lines for all tracks. Do they pulse? See 17-162.	Go to Seq 79.
77	Do all tracks fail to pulse?	Go to Seq 64
78	Change the bad zone.	Zone 1 - Y1T2 Zone 2 - Y1S2 Zone 3 - Y1R2
79	Do all the -VFC DATA lines pulse? See test point chart on 17-162.	Go to Seq 81.
80	If not:	Go to Seq 88.
81	Compare the -RECORD TRACK X lines for all tracks. Are any different? See test point chart on 17-162.	Go to Seq 92.
82	Does –STEP CTR LTH (Y1J2P12) pulse?	Change in order: 1. Y1M2 2. Y1L2 3. Y1K2
83	If not:	Change Y1J2.
84	Are all + RIC RESETS bad? See 17-162.	Go to Seq 64.

# 17-165

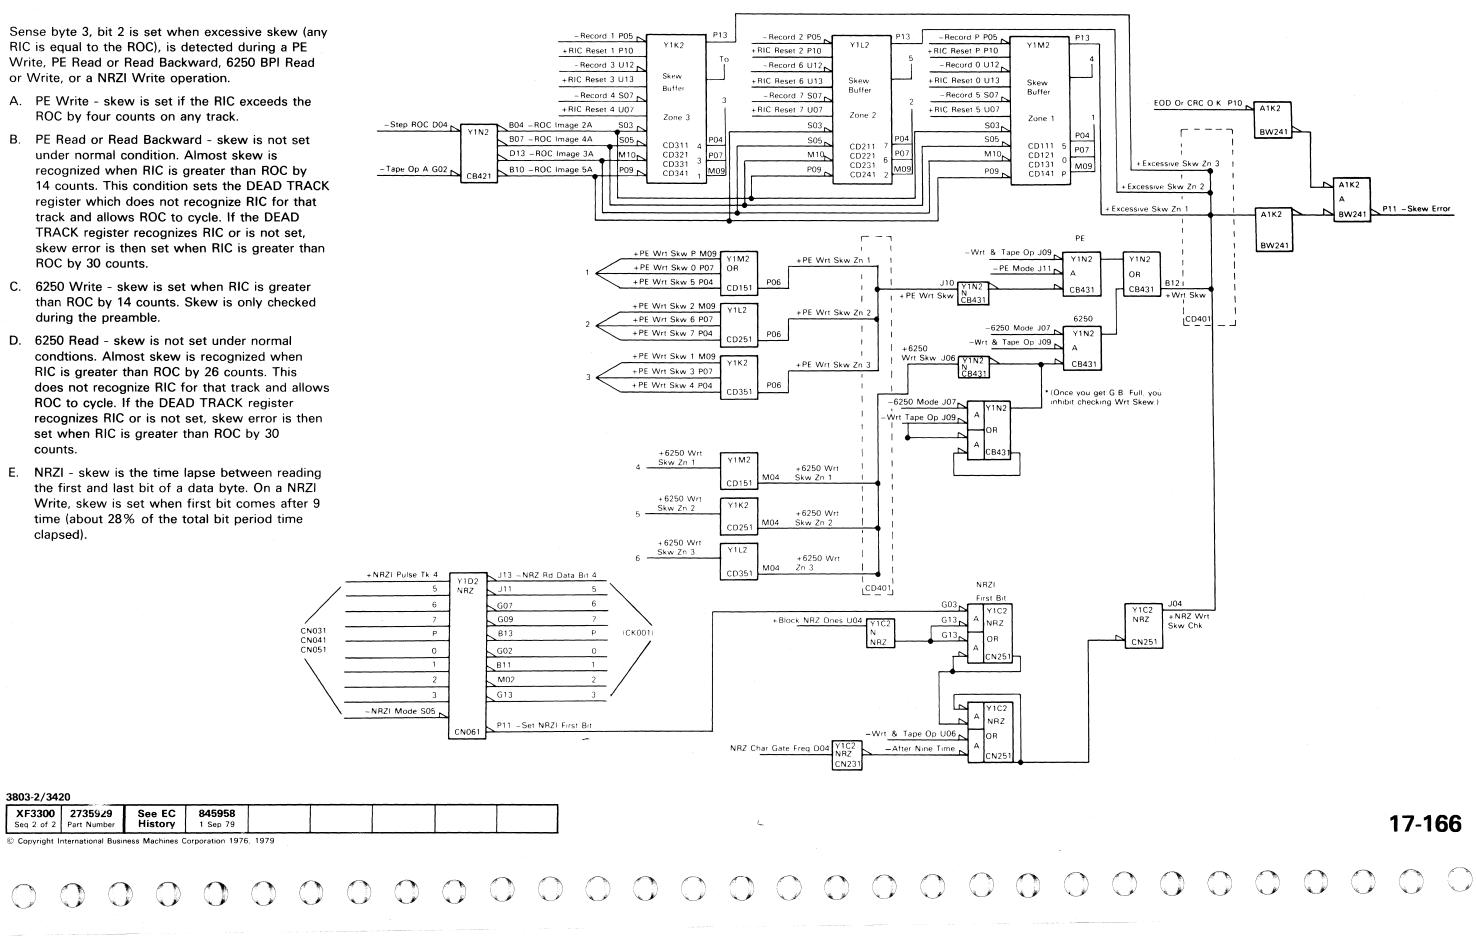

### 3803-2 CROSS-REFERENCE, PINS TO LOGICS

#### SKEW ERROR

Sense byte 3, bit 2 is set when excessive skew (any RIC is equal to the ROC), is detected during a PE Write, PE Read or Read Backward, 6250 BPI Read or Write, or a NRZI Write operation.

- A. PE Write skew is set if the RIC exceeds the ROC by four counts on any track.
- B. PE Read or Read Backward skew is not set under normal condition. Almost skew is recognized when RIC is greater than ROC by 14 counts. This condition sets the DEAD TRACK register which does not recognize RIC for that track and allows ROC to cycle. If the DEAD TRACK register recognizes RIC or is not set, skew error is then set when RIC is greater than ROC by 30 counts.
- C. 6250 Write skew is set when RIC is greater than ROC by 14 counts. Skew is only checked during the preamble.
- D. 6250 Read skew is not set under normal condtions. Almost skew is recognized when RIC is greater than ROC by 26 counts. This does not recognize RIC for that track and allows ROC to cycle. If the DEAD TRACK register recognizes RIC or is not set, skew error is then set when RIC is greater than ROC by 30 counts.
- E. NRZI skew is the time lapse between reading the first and last bit of a data byte. On a NRZI Write, skew is set when first bit comes after 9 time (about 28% of the total bit period time clapsed).

## **READ/WRITE VERTICAL REDUNDANCY CHECK (VRC)**

#### From 14-000, 17-010, 17-410

#### ERROR DESCRIPTION:

Sense Byte 3, Bit 0 is set:

- 1. During a 6250 bpi Read operation, when two track error pointers are not set and the ECC (Error Correction Code) cannot find the track to correct.
- 2. During a 6250 bpi Write operation, when the hardware error pointer and the ECC do not point to the same track on a single track error.
- During a PE operation, when a VRC (Vertical Redundancy Check) is detected without dead track or pointer information.
- 4. During a NRZI Read or Read Backward operation, when a VRC that cannot be corrected occurred.

The VRCR (Vertical Redundancy Check Register) is an error detection circuit that checks the vertical parity (across the width of the tape) of each byte.

#### Most Probable Causes:

The following list of cards can cause the problems covered in in this procedure. The cards are listed with the highest probability first. Lines with multiple cards have the same probability. Cards separated by slashes are interchangeable.

Cor	ntrol Unit	Single Tape Unit
A.	Y1F2	A. Erase head
Β.	Y1K2/Y1L2/Y1M2	B. Read card
A. B. C.	Y1J2	
D.	Y1N2	
D. E. F.	A1F2	
F.	Y1R2/Y1S2/Y1T2	
G.	Y1H2	
Н.	Y1G2, Y1C2, Y1P2	

- I. A1K2, Y1D2, A1C2, A1G2
- J. A1E2, A1H2, A1L2, A2Q2, A2T2, Y1Q2
- K. A2R2 (NRZI)

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problems or maintenance calls by going to MAP 00-030.

Seq	Condition/Instruction	Action
1	Is this a single tape unit failure?	For Models (4, 6, 8), go to 5B-000. For Models (3, 5, 7), go to 5A-000.
1A	Can the tape control read a prewritten tape forward and backward without a VRC error? Use Read Only tape (first seven files only).	Go to Seq 31.
2	Does the tape control fail only on the Read Backward command?	Go to Seq 88.
3	Does the tape control fail only on the Read Forward command?	Go to Seq 83.
4	Does the tape control fail only in PE mode?	Go to Seq 37.
5	Does the tape control fail only in NRZI mode?	Go to 17-310.
6	Do a LWR (8B) with gaps with tape away from load point or a Write operation (01) in 6250 bpi mode (byte count of 0B0) at the CE panel. Write data FF0. For gaps, jumper A1S2G08 to ground.	

Seq	Condition/Instruction	Action
7	Does the tape control run without a VRC error?	Change Y1J2.
8	Is -PE2 SLD (Y1Q2G03) at +6 volts?	Go to Seq 11.
9	Is +PE MODE (A1K2U11) minus?	Change Y1Q2.
10	If not:	Go to Seq 111.
11	Is +SET R/W VRC ERROR (Y1J2U09) always plus and not pulsing? (A plus 100 ns pulse is a normal set pulse.)	Change in order: 1. Y1J2 2. Y1C2.
12	Is +SET R/W VRC ERROR (Y1J2U09) always minus?	Change in order: 1. A1K2 2. Y1N2
13	Sync minus on -SET I CNT CMPR (Y1J2G03).	
14	Are there eight or more pulses in the first group of pulses on +SET I CNT (Y1F2U02)?	Go to Seq 16.
15	If not:	Go to Seq 22.
16	Does the last +SHIFT S2 (Y1J2J13) of the first group stay plus for a longer duration than the previous pulses (up to eight plus transitions) or are there more than eight plus transitions?	Go to Seq 107.
17	Is –WRITE OR READ FORWARD (Y1H2U07) plus?	Go to Seq 85.
18	Is +READ FORWARD (Y1J2D03) minus?	Change Y1J2.
19	Sync plus on -IBG BRANCH (Y1P2M07) (20 us/division).	
20	Is +SET XLT BUFFER (Y1N2G04) bad? Should be 26 groups of four pulses followed by a large group of pulses (approximately 150) when using LWR with gaps and a byte count of 0B0.	Go to Seq 74.
21	If not:	Go to Seq 62.
22	Is there only one pulse on -SET I CNT COMPARE (Y1J2G03)?	Go to Seq 27.
23	Adjust time base on the scope so all pulses on -COUNT EQUAL I (Y1F2S03) can be seen for one record. Place the scope on X10 magnifier and look at the second minus transition.	
24	Does -COUNT EQUAL I (Y1F2S03) fail to pulse?	Change Y1F2.
25	Does -COUNT EQUAL I (Y1F2S03) go minus when +SHIFT S2 (Y1J2J13) goes plus and stays plus?	Change Y1J2.
26	If not:	Go to Seq 16.
27	Sync plus on -IBG BRANCH (Y1P2M07).	

Seq	Condition/Instruction	Action
28	Are you getting -GB PTR for any track? (See Chart 1 on 17-171.)	Go to 17-700.
29	Are you getting -6250 bpi check for any track? (See Chart 2 on 17-171.)	Go to 17-700.
30	If not:	Change Y1J2.
31	Do a LWR (8B) with gaps with tape away from load point. Byte count 0B0. Write data FF0. For gaps, jumper A1S2G08 to ground.	
32	Sync plus on -IBG BRANCH (Y1P2M07).	
33	Is -ORC GATE (A1G2J07) good? (See timing chart on 17-023.)	Change A1G2.
34	Is -READ AND TAPE OP (A1F2J13) plus?	Change A1F2.
35	Is -STAT BIT 2 TO DF (A1K2U09) minus?	Change A2T2.
36	If not:	Change A1K2.
37	Do a LWR (8B) with gaps with the tape at load point, or a PE Mode Set (C3) followed by a Write (01) from the CE panel. Byte count 0B0. Write data 'FF0'. (LWR with gaps, jumper A1S2G08 to ground.)	
38	Sync minus on -WRITE CONDITION (A1G2G07) (50 ns per division).	
39	Is -PE2 SLD (Y1Q2G03) at +6 volts?	Change Y1Q2.
40	Is +SET R/W VRC (Y1J2U09) always plus (+100 ns pulse on error)?	Change in order: 1. Y1J2 2. Y1C2
41	Is +SET R/W VRC (Y1J2U09) always minus (+100 ns pulse on error)?	Change A1K2.
42	Is -CORRECT TRACK 8 ONLY (Y1J2M02) minus at time SET R/W VRC (Y1J2U09) is plus?	Change Y1J2.
43	Is -READ CYCLE (A1F2B05) bad? (See PE timing chart on 17-178-2.)	Change A1F2.
44	Is -FB DATA OR ALL ONES (Y1H2U09) good? (See PE timing chart on 17-178-2.)	Go to Seq 59.
45	Is +SAMPLE HDB (Y1K2G11) bad? (See PE timing chart on 17-177.)	Change Y1N2.
46	Is -ECC GB ADR 4 (Y1J2S03) bad? (See PE timing chart on 17-178-2.)	Change Y1J2.
47	Is +END OF DATA PWR (Y1H2M09) bad? (Goes plus approximately 550 ns after end one on DEVICE BUS IN TO DF.)	Go to Seq 53.
48	Is -GB ADR CTR 1 (Y1K2J06) bad? (See PE timing chart on 17-177.)	Change Y1N2.
49	Is -GB ADR CTR 2 (Y1N2G07) bad? (See PE timing chart on 17-177.)	Change Y1N2.

## **READ/WRITE VERTICAL REDUNDANCY CHECK (VRC) (Cont'd)**

Seq	Condition/Instruction	Action
50	Is -ECC GB ADR 1 (Y1J2U10) bad? (See PE timing chart on 17-178-2.)	Change Y1J2.
51	Is -ECC GB ADR 2 (Y1J2S11) bad? (See PE timing chart on 17-178-2.)	Change Y1J2.
52	If not:	Go to Seq 66.
53	Scope –FORMAT CHAR TRK x. (See Chart 7 on 17-171 and PE timing chart on 17-176.)	
54	Does one or more fail to pulse?	Go to Seq 56.
55	If not:	Change Y1H2.
56	Scope +DEVICE BUS IN to DF (see Chart 6 on 17-171 and PE timing chart on 17-176.)	
57	Is one or more bad?	Change bad card per Chart 6.
58	If not:	Change bad card per Chart 7 on 17-171 and Seq 53.
59	Is -XOUTA BIT 1 ALU2 to DF (A2Q2G09) plus?	Change A2Q2.
60	Is -STAT BIT 1 START WR RD (A2Q2B03) plus?	Change A2Q2.
61	lf.not:	Change Y1H2.
62	Scope –XLATE BFR TK test points (see Chart 4 on 17-171 and 6250 timing chart on 17-174).	
63	Is data from -ZLATE BFR TK good?	Go to Seq 81.
64	Is data from -XLATOR BUFFER OUT bad in more than one track?	Go to Seq 107.
65	If not:	Change bad Xlator buffer card per Chart 4.
66	Scope -SR2 REG test points (Chart 5 on 17-171). All bit lines should be plus.	
67	Are all bits bad?	Go to Seq 69.
68	If not:	Change Y1F2.
69	Scope -RESET S1 AND S2 (Y1J2S07). Is this line pulsing?	Change Y1F2.
70	If not:	Change Y1F2
71	Is +SAMPLE HDB (Y1K2G11) bad? (See PE timing chart on 17-177.)	Change Y1N2.
72	Is +GT ROC ADDR TO HDB (Y1N2D09) bad? (See timing chart on 17-173.)	Change Y1N2
73	If not:	Change Y1N2
74	Is +ECC GROUP FULL (Y1J2U07) good? (Should be only four plus pulses during data time.)	Change Y1N2.
75	Scope and compare -VFC DATA for all tracks (Chart 3).	

Seq	Condition/Instruction	Action
76	Are any tracks bad?	Change bad card per Chart 3.
77	Scope +EOD OR PE (Y1H2P04). Is it bad? (Should go plus before -IBG (Y1P2M07).)	Go to Seq 79.
78	If not:	Go to Seq 62.
79	Is +RESET VOTE LATCHES (Y1J2U13) good? Check from –IBG to –IBG (see 6250 timing chart on 17-173).	Go to Seq 71.
80	If not:	Go to Seq 96.
81	Scope –SR2 BITS (Chart 5). Are any bits bad?	Go to Seq 92.
82	If not:	Go to Seq 102.
83	Do a READ FORWARD command. Is +READ FWD (Y1J2D03) plus?	Change Y1F2.
84	Is -WRITE OR READ FORWARD (Y1J2M12) minus?	Change Y1J2.
85	Is -XOUTA BIT 1 ALU2 TO DF (Y1H2M12) plus?	Change A2Q2.
86	Is -STAT BIT 1 START WR RD (Y1H2P12) plus?	Change A2Q2.
87	If not:	Change Y1H2.
88	Do a READ BACKWARD (0C) command.	
89	Is +READ FORWARD (Y1J2D03) minus?	Change Y1F2.
90	Is -WR OR RD FWD (Y1J2M12) plus?	Change Y1J2.
91	If not:	Change Y1H2.
92	Are all SR2 bits bad?	Go to Seq 94.
93	If not:	Change bad card per Chart 5.
94	Is -RESET S1 AND S2 (Y1J2S07) pulsing?	Change Y1F2.
95	If not:	Change Y1F2.
96	Does +A3 or B3 (Y1J2B10) fail to pulse?	Change Y1J2.
97	Does +A1 or B1 (Y1J2B07) fail to pulse?	Change Y1J2.
98	Is +SAMPLE HDB (Y1K2G11) bad? (See 6250 timing chart on 17-175.)	Change Y1N2.
99	Is +GT ROC ADDR TO HDB (Y1N2D07) bad? (See 6250 timing chart on 17-173.)	Change in order: 1. Y1N2 2. Y1K2
100	Is +RESET VOTE LATCHES (Y1J2U13) pulsing?	Change in order: 1. Y1J2 2. Y1P2
101	If not:	Change in order: 1. Y1P2 2. Y1J2

Seq	Condition/Instruction	Action
102	Scope –FORMAT CHAR TRK x (See Chart 7 this page and 6250 timing chart on 17-175.)	
103	Are any FORMAT CHAR TRKS bad?	Go to Seq 105.
104	If not:	Change Y1N2.
105	Is more than one FORMAT CHAR TRK bad?	Change Y1N2.
106	If not:	Change bad card per Chart 7.
107	Is -ECC GB ADR 1 (Y1J2U10) bad? (See 6250 timing chart on 17-172.)	Change Y1J2.
108	Is -ECC GB ADR 2 (Y1J2S11) bad? (See 6250 timing chart on 17-172.)	Change Y1J2.
109	Is -ECC GB ADR 4 (Y1J2S03) bad? (See 6250 timing chart on 17-172.)	Change Y1J2.
110	If not:	Go to Seq 74.
111	Is +COMBINED R/W VRC ERROR (Y1N2P13) solid minus?	Change A1K2.
112	Is +SET R/W VRC (DOT OR) (Y1J2U09) solid minus?	Change Y1N2.
113	If not:	Change Y1C2.

an error detection circuit that checks the vertical parity

## WRITE TAPE MARK (WTM) CHECK

From 14-000	Seq Condition/Instruction	Action	Seq Condition/Instruction	Action
<b>ERROR DESCRIPTION:</b> Sense Byte 5, Bit 2 is set when tape mark is not written properly. This bit is also set if any byte fails to activate TAPE MARK (TM) DETECTED during the time when ROS2 does a readback check of 35 consecutive tape mark bytes.	4 The following lines should pulse during the sync, except for 1, 3, and 4 on a Write Tape Mark operation. Are they all good? Zone 1	Change the card in the zone that was bad in Seq 3. Zone 1, change Y1T2. Zone 2, change Y1S2. Zone 3, change Y1R2.	10 Check the following lines to see if they match the TUBO lines in Seq 5. Do they all match while the sync is minus? Voltage 0v to +5v	Go to 18-010.
<ul> <li>MOST PROBABLE CAUSES: The following list of cards can cause the problems covered in this procedure. The cards are listed with the highest probability first. Lines with multiple cards have the same probability. Cards separated by slashes are interchangeable.</li> <li>A. Y1R2/Y1S2/Y1T2</li> <li>B. A1G2, A1H2, A1K2, A2Q2, Y1C2, Y1P2</li> <li>ADDITIONAL CARDS AFFECTED:</li> <li>A. A2D2</li> <li>B. A2E2</li> </ul>	-DEVICE BUS IN 0 TO DF Y1T2M04     -DEVICE BUS IN P TO DF Y1T2S04     -DEVICE BUS IN 5 TO DF Y1T2D13     Zone 2     -DEVICE BUS IN 2 TO DF Y1S2M04     -DEVICE BUS IN 6 TO DF Y1S2S04     -DEVICE BUS IN 7 TO DF Y1S2D13     Zone 3     -DEVICE BUS IN 1 TO DF Y1R2M04     -DEVICE BUS IN 3 TO DF Y1R2S04	These cards are interchangeable. If there, were bad lines in more than one zone, change Y1Q2 first.	-BUSOUT P SECONDARYA2E2G07-BUSOUT 0 SECONDARYA2E2G08-BUSOUT 1 SECONDARYA2E2B03-BUSOUT 2 SECONDARYA2E2B04-BUSOUT 3 SECONDARYA2E2B12-BUSOUT 4 SECONDARYA2E2D13-BUSOUT 5 SECONDARYA2E2M07-BUSOUT 6 SECONDARYA2E2M08-BUSOUT 7 SECONDARYA2E2U11	
C. A2L2 D. A2T2	-DEVICE BUS IN 4 TO DF Y1R2D13		11 If not:	Change A2E2
<ul> <li>E. B2E2</li> <li>F. A2R2</li> </ul> Always start with Seg 1 and follow the procedure in sequence unless directed otherwise	5 Do the same TAPE UNIT BUS OUT lines pulse as the DEVICE BUS IN TO DF lines (Seq 4) did during the sync? -TUBO BIT P A1H2U07	Go to Seq 14.	12 Check the following lines to see if they match the TUBO lines in Seq 5. Do they all match while the sync is minus?	Go to 18-010.
Remember to END all problems or maintenance calls by going to MAP 00-030.	-TUBO BIT 0 A2R2S03		Voltage $0v$ to $+5v$	
Seg Condition/Instruction Action	-TUBO BIT 1 A2R2B12		-BUS OUT P A2E2G07	
1       Is this a single tape unit failure?       For Models 4, 6, 8, go to 5B-000.         For Models 3, 5, 7, go to 5A-000.	-TUBO BIT 2         A2R2D05           -TUBO BIT 3         A2R2G02           -TUBO BIT 4         A2R2B07           -TUBO BIT 5         A2R2B10		-BUS OUT 0         A2E2G08           -BUS OUT 1         A2E2B03           -BUS OUT 2         A2E2B04           -BUS OUT 3         A2E2B12	
1A       Does the failure occur while operating in NRZI Mode (Sense Byte 6, Bit 0 ON or Sense Byte 6, bit 4 OFF and Bit 3 ON)?       Go to Seq 31.	- TUBO BIT 6 A2R2G13 - TUBO BIT 7 A2R2S02 6 Is this a 1x8 machine?	Go to Seq 12	-BUS OUT 4         A2E2D13           -BUS OUT 5         A2E2M07           -BUS OUT 6         A2E2M08           -BUS OUT 7         A2E2M08	
2 Sync negative on -TAPE OP A Change A2D2. (A1K2B10).	7 Is the tape unit being used to	Go to Seq 10	-BUS OUT 7 A2E2U11	Change A2E2
Does +TM CONFIGURATION (A2D2S10) become plus while the sync is minus in a WTM (1F) operation?	<ul><li>troubleshoot the failure connected directly to the tape control you are using?</li><li>8 Check the following lines to see if they</li></ul>	Go to 18.010	14 Does –GATE WRITE (A1H2D03) become minus while the sync is minus?	Go to Seq 26.
3       The following lines should become minus during the sync, except for 1, 3, and 4 on a Write Tape Mark operation. Are they all good?       Change Y1P2.         Zone 1	<ul> <li>a Check the following lines to see if they match the TUBO lines in Seq 5. Do they all match while the sync is minus?</li> <li>Voltage 0v to +5v <ul> <li>BUS OUT P PRIMARY</li> <li>A2E2J07</li> <li>BUS OUT 0 PRIMARY</li> <li>A2E2D03</li> <li>BUS OUT 1 PRIMARY</li> <li>A2E2D04</li> <li>BUS OUT 2 PRIMARY</li> <li>A2E2D09</li> <li>BUS OUT 4 PRIMARY</li> <li>A2E2D09</li> <li>BUS OUT 5 PRIMARY</li> <li>A2E2D09</li> <li>BUS OUT 5 PRIMARY</li> <li>A2E2D09</li> <li>BUS OUT 6 PRIMARY</li> <li>A2E2P02</li> </ul> </li> <li>9 If not:</li> </ul>	Change A2E2

53	If not:	Go to ALD BW061, BW071, and BW081 and find out why the Write Triggers are not turned off.
54	If the failing 7-track mode is unknown, write the tape and read it back in the various 7-track modes to determine the failing mode. (See 40-008 for 7-track mode set commands.) Byte Byte	
	Count     Count       Dialed     Written       00        through     count dialed       FE     plus three	
55	FF 2 Is the failure a Hi Clip VRC (Byte 3, bit 4)?	Go to Seq 59
56	Is the failure a READ VRC error (Byte 3, bit 0)?	Go to Seq 106.
57	Is the failure a LRC error (Byte 3, bit 1)?	Go to Seq 108
58	If not:	Recheck symptoms.
59	While writing the tape in the failing mode and failing data pattern sync minus on -SET NRZI FIRST BIT (Y1C2G03). Is the sync present?	Go to Seq 65.
60	Is +RESET FIRST BIT (Y1C2G13) always plus?	Change Y1C2.
61	Is -SET NRZI 1ST BIT (Y1C2G03) pulsing correctly?	Change Y1C2.
62	Is NRZI CHARACTER GATE FREQ (Y1C2D04) a constant plus or minus?	Change A1K2.
63	Check the DEVICE BUS IN $x$ TO DF lines. See – DEVICE BUS IN $x$ TO DF chart on 17-312 for test points. Are any of these lines pulsing?	Change Y1D2
64	If not:	Go to 18-020.
65	Does the failure occur while the tape control is writing in Data Convert or Translate mode?	Go to Seq 92.
66	Does the failure occur while the tape control is writing in an even parity mode?	Go to Seq 87.

Seq	Condition/Instruction	Action
67	Is there a Wr Tgr VRC error?	Go to 17-170.
68	Does the failure occur while writing in 200 bpi only (23 mode set)?	Change A1K2.
69	Does the failure occur while writing in 556 bpi only (73 mode set)?	Change A1K2.
70	Does the failure occur while writing in 800 bpi only (83 mode set)?	Change A1K2.
71	Does the tape control fail in 800 bpi, 556 bpi, and 200 bpi modes?	Go to Seq 73.
72	If not:	Recheck symptoms.
73	When writing a 7-track record with the Data Converter (DC) off, the data shifts of NRZI CHAR GATE should equal the number of data bytes in the records (see 7-track timing chart on 17-313). In the example given, there are seven shifts of +NRZI CHAR GATE (there is one more shift for the LRCC character in an odd byte record for 7-track mode). Does NRZI CHAR GATE shift as explained above?	Go to Seq 76.
74	Is -DATA CONVERTER ON (A1L2B13) minus?	Change A1L2.
75	If not:	Change A1E2.
76	Is -STAT BIT 3 7-TRACK (Y1C2M05) plus?	Change A2Q2.
77	Is -XLATE ON (A1L2D09) minus?	Change A1L2
78	Is +PARITY EVEN (A1L2G04) minus?	Change A1L2
79	Scope the –DEVICE BUS IN x TO DF lines (see chart on 17-312 for test points). Check each byte for odd parity (for the first byte in the record, ensure that an odd number of tracks shift plus back to minus). See 7-track timing chart on 17-313 for an example of how line shifts look when there is a one on a track and the –DEVICE BUS IN x TO DF line shifts plus for a short time and then goes back to a minus level.	
80	Does any byte in the record have even parity?	Go to Seq 84.
81	Is +RESET RD REG 1 (Y1C2S05) always plus?	Change Y1C2.
82	Is -R/W VRC BAD A (Y1D2U09) always minus?	Change Y1D2.
83	If not:	Change Y1C2.
84	Sync on -WRT CONDITION (A1G2G07)	

	Converter (DC) off, failing bit density:

### **ENVELOPE CHECK**

Sense byte 3, bit 4 is set:

- A. PE Write when a phase error pointer is set because a phase shift is detected which exceeds the capability of the VFC circuits on read back data from the tape unit. This also sets data check.
- B. NRZI when a NRZI Hi Clip VRC error occurs.
- C. PE Read, 6250 Read, 6250 Write when any time sensor becomes inactive. The microprogram sets ENVELOPE ERROR.

**ENV Check Block or ENV Loss**

### END DATA CHECK

#### From 14-000 and 17-190

#### ERROR DESCRIPTION:

Byte 3, bit 3 is set during PE Read operation if the ending ones marker is not detected, or if the postamble contains less than six or more than 50 bytes.

This bit has different meanings depending on the subsystem operating mode and the status of Sense Byte 5, Bits 5 and 6.

#### In PE mode:

- 1. If Bits 5 and 6 are OFF, Short Postamble is indicated.
- 2. If Bit 5 is ON and Bit 6 is OFF, a Partial Record is indicated.
- 3. If Bit 5 is OFF and Bit 6 is ON, an Excessive Postamble is indicated.

The only time Byte 3, Bit 3 indicates an End Data Check is during a PE Read operation. For all other operations, Byte 3, Bit 3 indicates a CRC error.

#### Most Probable Causes:

The following list is of the known cards which can cause the problems covered in this procedure. Cards are listed with the highest probability first. Lines with multiple cards have the same probability.

A. A1D2

B. Y1H2, Y1G2

ADDITIONAL CARDS AFFECTED:

- A. A1K2
- B. A2Q2 C. A2L2
- D. A2D2

**Always** start with Seq 1 and follow the procedure in sequence unless directed otherwise. **Remember** to END all problems or maintenance calls by going to MAP 00-030.

Seq	Condition/Instruction	Action
1	Take the tape control offline and set up the CE panel to perform the failing command sequence with Stop On Data Flow Check switch ON.	
2	Is -EOD OR CRC OK DOT (A1K2P10) minus?	Go to Seq 9.
3	Is +9 TRACK CHECK CRC (Y1H2M11) plus?	Go to Seq 13.
4	Sync negative on _STAT BIT 0 TAPE OP TO DF (A1K2U06). Is _6250 MODE (Y1H2S09) minus while the sync is minus?	Go to Seq 7.
5	Is -XOUTA BIT 4 ALU2 TO DF (A1K2D09) minus while the sync is minus?	Change A1K2.
6	If not:	Change in order: 1. A2Q2 2. A2L2
7	Is -BUFFER CRC ERR (A1D2J04) minus?	Go to Seq 11.
8	If not:	Change in order: 1. Y1H2 2. A1D2
9	Sync negative on -STAT BIT 0 TAPE OP TO DF (A1K2U06). Does -EOD OR CRC OK DOT (A1K2P10) become minus while the sync is minus?	Change A2D2.

Condition/Instruction	Action
s –WRT OR READ FORWARD Y1H2U07) plus?	Go to ALD CH131BF6 and follow line back to failing point.
s -GB ADR CNTR 1 (Y1K2J06) bad? See timing chart on 17-705.)	Go to ALD CB441GD6 and follow line back to failing point.
s -GB ADR CNTR 2 (Y1K2P02) bad? See timing chart on 17-705.)	Go to ALD CB441GF6 and follow line back to failing point.
s +STEP RIC TRACK X bad for failing racks? (See timing chart on 17-704.)	Go to Seq 7.
Did –VFC DATA for the failing track have ess than ten pulses while writing the preamble? (See Pointer Probe List on 7-701.)	Go to Seq 7.
Did less than ten of the pulses in Seq 25 secur before -VFC PRIME DATA became ninus? (See Pointer Probe List on 7-701.)	Go to Seq 7.
s +RESET FORMAT LTHS (Y1J2S09) a olid level?	Change Y1J2.
Does -VFC PRIME DATA TRACK become ninus after -XOUTA BIT 6 ALU2 TO DF Y1K2D06) is minus? (See timing chart on 7-705 and the Pointer Probe List on 7-701.)	Replace in order: Zone 1 — Y1M2 Zone 2 — Y1L2 Zone 3 — Y1K2
Does -XOUTA BIT 6 ALU2 TO DF Y1K2D06) become minus at the correct ime? (See timing chart on 17-705.)	Go to Seq 7.
f not:	Go to ALD AA141 and follow line back to failing point.
s a pointer ON for the failing track while unning in 6250 bpi mode?	Go to Seq 34.
s +END OF DATA OR PE (Y1G2J04) ninus while writing the record?	Go to ALD CH131GK6 and follow line back to failing point.
f not:	Go to Seq 17.
s +INVALID CHARACTER minus for the ailing track while writing data? (See iming chart on 17-704 and 17-705.)	Go to Seq 18.
Does -FORMAT CHARACTER X become ninus on all other tracks at the same time t does on the failing track? (See timing thart on 17-004.)	Change Y1H2.
Does -FORMAT CHARACTER X become ninus at the wrong time for the failing rack? (See timing chart on 17-704.)	Go to Seq 18.
f not:	Change Y1H2.
s – SET ECC BUFFER (Y1J2G12) good? See timing chart on 17-703.) Note: This pulse is hard to see. Turn up he intensity on the scope.	Go to Seq 41.

#### **POINTER SYSTEM**

Seq	Condition / Instruction	Action
39	Is -DECODE ABC (Y1J2G13) good? (See Timing Chart on 17-703.)	Change Y1J2.
40	If not:	Go to ALD CH011FB6 and follow line back to failing point.
41	Sync minus ON and display -SET ECC BUFFER (Y1J2G12).	
42	Does -EPI (Y1G2U03) go minus while -SET ECC BUFFER (Y1J2G12) is minus?	Replace in order: 1. Y1F2 2. Y1G2 Go to Seq 17.
43	If not:	Change Y1G2.
44	Does -PE PHASE ERROR ever go minus for the failing tracks while writing the record? (See Pointer Probe List on 17-701.)	Go to Seq 7.
45	Does –PHASE ERROR ever go minus for the failing tracks while writing the record? (See the Pointer Probe List on 17-701.)	Go to Seq 7.
46	Is +Dead Track Register plus for the failing tracks?	Go to Seq 58.
47	Is -SET GROUP BUFFER HWD PTRS (Y1N2D05) bad? Note: Short, hard to see pulses. Turn up scope intensity.	Change Y1N2.
48	If not:	Change: For Zone 1 — Y1M2 For Zone 2 — Y1L2 For Zone 3 — Y1K2
49	Is -TIME SENSE ever plus for the failing track while writing the record? (See Pointer Probe List on 17-701.)	Go to Seq 7.
50	Is +PE WRT SKEW plus for the failing track while writing the record? (See Pointer Probe List on 17-701.)	Go to 17-160.
51	Is -POINTER BUS always plus for the failing tracks during the record time? (See Pointer Probe List on 17-701.)	Change Y1P2.
52	Is -ROC CYCLED (Y1G2P11) bad? (See timing chart on 17-702.)	Go to ALD CC121BJ6 and follow line back to failing point.
53	Is -GATED PGM SYNC (Y1G2M11) bad? If in 6250 mode see timing chart on 17-702. If in PE mode, see timing chart on 17-705. (See Pointer Probe List on 17-701.)	Go to ALD CC121BM6 and follow line back to failing point.
54	Is -ALMOST SKEW minus during the record time? (See Pointer Probe List on 17-701.)	Go to 17-160.

Seq	Condition / Instruction	Action
55	If not:	Go to Seq 16.
56	Is -READ FORWARD (Y1K2P03) plus?	Go to ALD CH011EE2 and follow line back to failing point.
57	If not:	Go to Seq 22.
58	Ground pointer bus for bad track and recheck the dead track register for the failing track. Does the register still become plus?	Go to Seq 49.
59	If not:	Change card for bad zone: Zone 1—Y1M2 Zone 2—Y1L2 Zone 3—Y1K2

#### CLOCK CHECK

Remember to END all problem or maintenance calls by going to MAP 00-030.							
Seq	Condition/Instruction	Action					
1	Perform an LWR from the CE panel using any byte count and any density.						
2	Check all clock timings. If any are out of phase or fail to pulse, change card A1C2. Refer to Figure below. Sync on $-0-50$ CLOCK BUS YA (A1C2S12).						

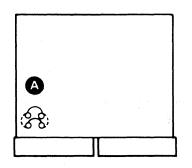

#### **CLOCK TIMING CHART**

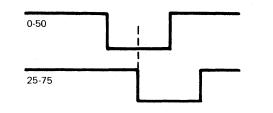

#### **TYPE 2272 MST CARD ADJUSTMENT**

Whenever a type 2272 MST card is replaced, the new card must be adjusted as follows:

1. Plug the jumpers horizontally as shown A

- 2. Sync oscilloscope on 0-50 CLOCK PULSE (A1C2S10) and scope 25-75 CLOCK PULSE (A1C2U12).
- 3. Compare the display obtained with the jumpers plugged horizontally, and the display obtained with the jumpers plugged vertically (as indicated by the broken lines on the above illustration). Determine which plugging arrangement gives the optimum centering of the two clock pulses and leave jumpers plugged that way.
- 4. The illustration shows the pulses ideally centered.

17-800

#### **1x8 SELECTION LOGIC**

#### From: START 1, 15-010, 16-170, 16-171, 17-310

**Note:** If you have a 1x8 with address 8-F, change the address plugging to 0-7 before continuing (see 90-130). Return the address to 8-F before returning tape unit to the customer.

This procedure enables you to statically analyze solid access problems on a 1x8 (Selection) subsystem. Stopping ALU2 at FCHSNS in ALU2 microcode listing will allow static scoping of the first sense byte from the tape unit.

Setup:

Perform the following commands to the failing address:

 $\begin{array}{l} \mbox{Cmnd 1} = 8Bx \\ \mbox{Cmnd 2} = 8Bx \\ \mbox{Cmnd 3} = 8Bx \\ \mbox{Cmnd 4} = 8Bx \\ \mbox{Byte Count} = FE0 \\ \mbox{Write Data} = FF0 \end{array}$ 

Jumper A1S2G08 to ground to write with gaps. See 12-000 for CE panel operation.

Chart A on 18-001 provides the selection logic cards, outbound and inbound crosspoint (XPT) card, and device bus cables by tape unit address.

#### Notes:

- 1. Bit 7 requests tape unit sense byte 0. Bit 8 indicates DEV SELECT. TU SELECT lamp will not be on.
- 2. Bus In bit explanation.

Bit 0 = Backward Bit 1 = Not File Protect Bit 2 = EOT Bit 3 = BOT Bit 4 = Write Status Bit 5 = Start (Ready) Bit 6 = Unit Check Bit 7 = Not Busy

3. A write command requires bits 1, 5, and 7 ON and bit 6 OFF. After the first Write, Backward is off and Write Status is on.

Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problem or maintenance calls by going to MAP 00-030.

Seq	Condition/Instruction	Action
1	Set up ALU2 to stop on address 0F5. Set ROS Mode switch to STOP. Operate Set ROS Mode switch momentarily. Set COMPARE Register to 0F5. Set ALU1/ALU2 switch to ALU2. Set Display Select switch to IC.	
2	Operate START switch. Did ALU2 stop at 0F5?	Go to Seq 4.
3	If not:	Device is BUSY. Go to Seq 51.
4	Reset tape control and set COMPARE Register to 2E6 (FCHSNS). Set Display Select switch to IC.	
5	With ALU2 setup to stop at address 2E6 (FCHSNS), operate Start switch.

#### **DEVICE SWITCH FEATURE**

# From: 16-180, 16-190, 16-212, 17-051, 17-080, 17-081, 17-160, 17-000

A device switching feature can be installed only in a "host" tape control; (a tape control with tape unit signal cables attached). A device switching feature allows the tape units attached to a host tape control to be accessed by one, two, or three additional tape controls, as well as by the host tape control.

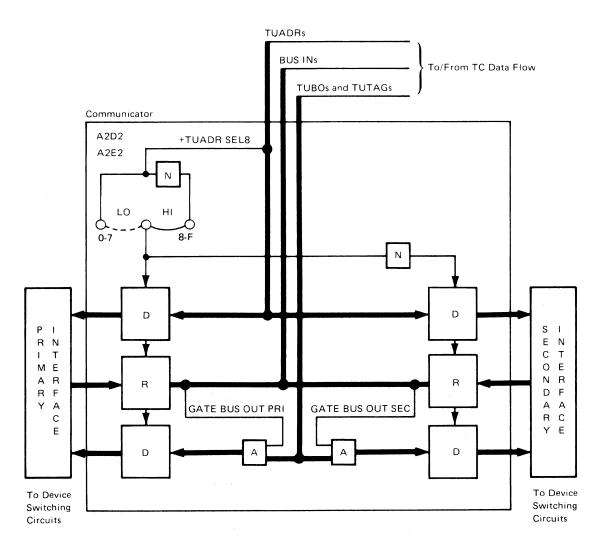

A communicator feature must be present in all tape controls, including the host tape control, to use a device switching feature. Each tape control with the communicator feature installed has two interfaces: a primary interface and a secondary interface. The primary interface is used to communicate with another tape control. The primary interface is always connected to tailgate positions 01TA1A7 (BUS) and 01TA1A8 (TAG).

The communicator feature includes a jumper that selects its primary interface to access tape unit addresses 0–7 ("Low") or 8–F ("High").

This jumper causes the TUADR SELECT 8 line to select the drivers and receivers of the correct interface, as shown. For example, if +TUADR SELECT 8 is active and the jumper is plugged for "High", the primary interface will access tape units 8-F, and the secondary interface will access tape units 0-7.

A host tape control always accesses attached tape units via its secondary interface. A tape control with a communicator feature installed but no tape units attached communicates with other tape controls via both its primary and secondary interfaces. After successful selection of a tape unit, the device switching circuits must return the GATE BUS OUT signal to the communicator before the operation can proceed.

#### Tape Subsystem Cabling Diagram

# HOW TO USE SECTION 18-XXX

**18-010** provides descriptions and basic ground rules for using sections 18-015 and 18-020.

18-010

**18-015** is the Most Probable Cause. Analysis should be used first, to resolve a failure.

**18-020** is a troubleshooting procedure to resolve a failure if Section 18-015 fails to do so.

#### FAILURE MODES

- A. One tape control cannot access a certain tape unit or a certain combination of tape units.
- B. Two or more tape controls cannot access a certain tape unit.
- C. A control line or data line is failing from a certain tape control, to or from a certain tape unit.
  - 1. Line is never active.
  - 2. Line is always active.
  - 3. Line has slow response.
- D. Crosstalk or interference is occurring between two tape units operating concurrently from two tape controls.
- E. Two tape units operate simultaneously from one tape control.

#### **DEVICE SWITCH FEATURE (Cont'd)**

#### **RULES AND DEFINITIONS**

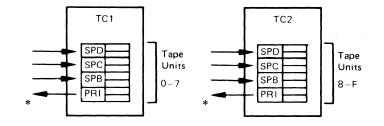

- 1. Because of the cabling and addressing flexibility provided by the device switching feature, the procedures reference switch paths with respect to the device switching capability of the host tape control. For example, a 4x8 configuration has four switch paths (SPs): SP-A (internal), SP-B, SP-C, and SP-D.
- 2. In this procedure:
  - a. The tape control that hosts tape units 0-7 is called TC1.
  - b. The tape control that hosts tape units 8-F is called TC2.
  - c. A tape control that does not host tape units is called TC3, TC4, or TC5.
  - d. The operating tape control is the tape control attempting to establish a switch path to perform an operation with a given tape unit.

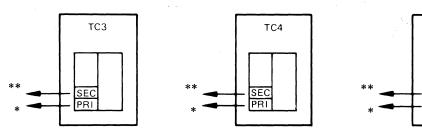

#### TAPE SUBSYSTEM CABLING FOR THE **DEVICE SWITCH FEATURE**

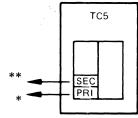

- 1. A subsystem has a maximum of four tape controls cabled together using a device switch feature.
- 2. Cabling between tape controls must be known before the procedures on 18-015 or 18-020 can be used.
- 3. Tape control 1 (TC1) and tape units 0-7. The path to the device switch is internal via the SP-A circuits of tape control 1.
- 4. Tape control 2 (TC2) and tape units 8-F. The path to the device switch is internal via the SP-A circuits of tape control 2.
- 5. All other tape control to tape unit combinations (TC3, TC4 and TC5) have paths that include external cables from the tailgate of the operating tape control to the tailgate of the host tape control. To identify the switch path, check to see if the operating tape control is cabled to the SP-B, SP-C, or SP-D circuitry of the host tape control before using procedures 18-015 or 18-020.

- 6. An external switch path consists of two cables: a Bus cable and a Tag cable. Bus and Tag cables can be interchanged to isolate failures.
- 7. Make a drawing of the external switch path cabling for the subsystem at your location.
- 8. A subsystem cannot have more than four tape controls.

A maximum of four (4) tape controls can be cabled together using a device switch feature. See 90-050 through 90-080 (Installation section).

XF5600         2735952         See EC         845958           Seq 2 of 2         Part Number         History         1 Sep 79	3803-2/342	20	•	-

#### 18-011

\* These tailgate connectors (01TA1A7-BUS, 01TA1A6-TAG) are used by the primary interface of this tape control's communicator feature.

\*\* These tailgate connectors (01TA1A5-BUS, 01TA1A6-TAG) are used by the secondary interface of this tape control's communicator feature.

CAUTION: After interchanging or replacing a card, always reset both the tape control and the tape unit before repeating the test procedure to verify a fix.

#### **DEVICE SWITCH FEATURE (Cont'd)**

#### **DEVICE SWITCHING BLOCK DIAGRAM** FOR 2x8 SWITCH

Tape control 1 (TC1) hosts tape units 0-7; Tape control 2 (TC2) hosts tape units 8-F.

Tape control 
 operator panel switches must be ON to access these tape units.

A pair of cables **G** connect the other tape control, via its communicator feature, to this device switch.

The indicated groups of tape units **(**0-2, 4-7; or 8-B, C-F) are associated with the card groups below them.

Each switch path (SP) ( through the device switch requires:

2-Device switch logic cards

2-Inbound crosspoint (XPT) switch cards

2-Outbound XPT switch cards.

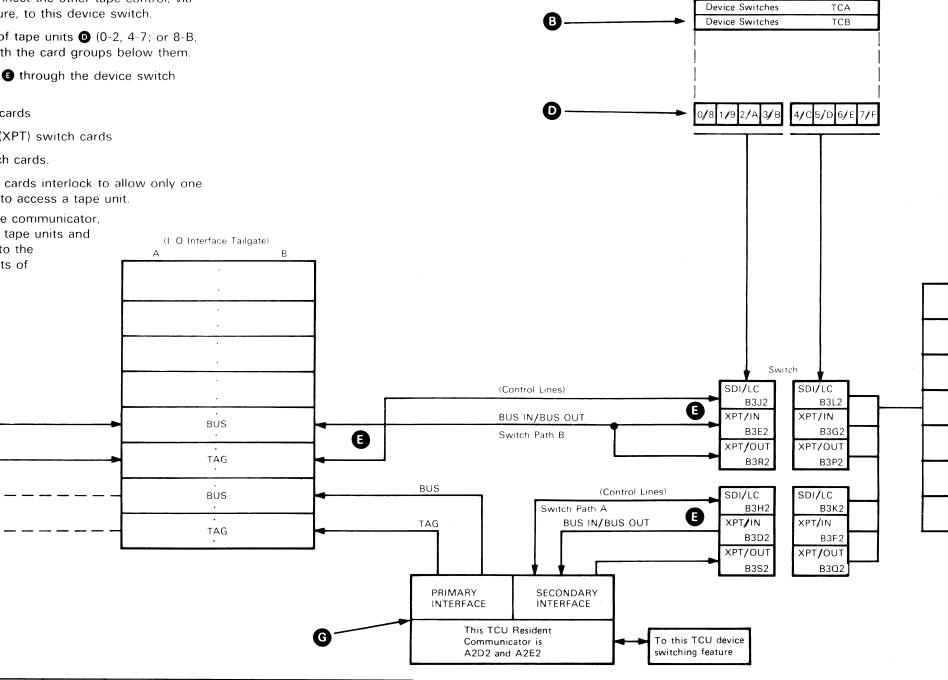

Device switching logic cards interlock to allow only one tape control at a time to access a tape unit.

Tape control, G via the communicator, accesses the attached tape units and the lower two cables to the device switching circuits of another 3803.

From	: 18-015	
select	ype of device switch used determines the ch tion logic are located on 18-001. 2. Charts f 3-028.	
	<b>ys</b> start with Seq 1 and follow the procedur <b>ember</b> to END all problem or maintenance c	
Seq	Condition/Instruction	Action
1	Are you entering this procedure with an interrupt problem?	Go to Seq 295.
2	Are you entering this procedure with a tach start problem?	Go to Seq 295.
3	Are you entering this procedure with a meter problem?	Go to Seq 295.
4	Are you entering this procedure with a control command problem?	Go to Seq 295.
5	Mount a CE work tape on one of the failing tape units. Load and Ready the tape unit.	
6	Take the tape control <b>offline</b> , and set up the CE panel to do multiple LWR (8B) commands at load point, using the failing tape unit. Use Byte Cnt = FE0 Write Data and Go Down = FF0 Reset the tape control. <b>Note</b> : Connect LWR jumper from A1S2G08 to ground.	
7	Set up an ALU2 COMPARE STOP on 0F5 (EXECSTSZ) (See 12-011) and operate the Start switch.	
8	Did it stop at 0F5?	Go to Seq 10
9	If not:	TU BUSY response received. Go to Seq 62.
10	Turn the ROS Mode switch to Normal, then operate the Reset switch.	
11	Set up an ALU2 COMPARE STOP at 2E6 (FCHSNS) (See 12-011) and operate the Start switch.	
12	Set Display Select switch to Bus Out and the ALU1/ALU2 switch to ALU2.	
13	Are data bits 0-7 all Off?	Go to Seq 15
14	Any data bit 0-7 On indicates an ALU2 problem.	
15	Do tag bits 8-11 = 1000?	Go to Seq 17
16	Any other bit combination indicates an ALU2 problem.	
17	Set Display Select switch to Bus In and the ALU1/ALU2 switch to ALU2.	
18	Are tape unit data bits 0-7 all Off?	Go to Seq 20

Seq	Condition/Instruction	Action
19	Any tape unit data bits that are On are "hot" bits from the tape unit signal path.	Go to Seq 89.
20	Are tape unit address bits 8-11 correct?	Go to Seq 22.
21	If not:	Go to Seq 6.
22	Turn ROS Mode switch to Step and step one time.	
23	This requests Sense Byte 0.	
24	Set Display Select switch to Bus Out and the ALU1/ALU2 switch to ALU2.	
25	Do bits 0-11 = hex 018?	Go to Seq 27.
26	Any other bit combination indicates an ALU2 problem.	
27	Set Display Select switch to Bus In and the ALU1/ALU2 switch to ALU2.	
28	Do bits 0-7 = D5 (Sense Byte 0)?	Go to Seq 31.
29	Are bits 0-7 all OFF?	Go to Seq 62
30	Any other bit combination may indicate an XPT card or cable problem.	Go to Seq 109.
31	Are TU address bits 8-11 correct?	Go to Seq 33.
32	Has the setup been changed?	Go to Seq 6.
33	Turn ROS Mode switch to Normal, then operate Reset switch and operate Start switch.	
34	Set Display Select switch to CE Reg and Data Entry Select switch to Cmd1.	
35	Are lights flashing hex CB?	Go to Seq 37.
36	If lights are not flashing, command sequence you set up is not running. If lamps are flashing but not showing CB, tape control is not performing an LWR.	Go to Seq 46.
37	Set Display Select switch to Bus Out and the ALU1/ALU2 switch to ALU2.	
38	Do data bits 0-7 = hex FF?	Go to Seq 40.
39	In Seq 6, you should have set up an FF data pattern. This may be a data flow problem.	Go to Seq 6.
40	Do tag bits 8-11 = hex D (1101)?	Go to Seq 42.
41	If not, this is an ALU2 problem.	
42	Set Display Select switch to Bus In and the ALU1/ALU2 switch to ALU2.	-
43	Do tape unit data bits 0-7 = hex FF?	Go to Seq 45
44	Any missing bits may indicate an XPT card or cable problem.	Go to Seq 109.

#### **DEVICE SWITCHING FEATURE—TROUBLESHOOTING PROCEDURE (Cont'd)**

Seq	<b>Condition/Instruction</b>	Action
74	Remember this sequence number.	Go to Seq 136.
75	DEVICE SELECT not received at the device switch logic card.	
76	DEVICE SELECT comes from communicator card A2E2 in the operating tape control.	
77	Remember this sequence number.	Go to Seq 136.
78	This tape unit is committed to another tape control.	Go to Seq 215.
79	A. Check the Operator Panel Enabled switch.	
	B. Test switch operation.	
	C. Go to ALD XC700 Sheet 1 Chart E for cabling on 2x8 device switches.	
	D. Go to ALD XC701 Sheet 3 Chart E for cabling on 3x8 or 4x8 device switches.	
80	There is a POWER DOWN signal from the operating tape control.	Go to Seq 136.
81	The COMMITTED latch has been set correctly.	
82	The line that sets the COMMITTED latch leaves the device switch logic card as GATE BUS OUT and must be returned to communicator card A2E2 in the operating tape control to allow the gating of the TAGs and BUS OUT lines.	
83	Remember this sequence number.	Go to Seq 136
84	On the device switch logic card you identified in Seq 65, scope GATE BUS OUT (pin B04).	
85	Is pin B04 at +0.2v?	Go to Seq 88.
86	Is pin B04 at ground level?	Go to Seq 163.
87	If pin B04 is at +4.5Vdc A. Check the socket connections on the device switch logic card identified in Seq 65.	
	B. Replace the device switch logic card, making sure the address jumpers are plugged correctly.	
88	Determine if BUS OUT BIT 7 is present at the tape unit.	Go to Seq 109. line that is at ground level is shorted or open at both ends.
		Find and correct such a problem before proceeding.
89	Go to Chart A (see note) and record the cards and cables needed to use the following procedures. Return to Seq 90.	
90	Is there more that one "hot" bit?	Go to Seq 100.

#### DEVICE SWITCHING FEATURE — TROUBLESHOOTING PROCEDURE (Cont'd)

Seq	Condition/Instruction	Action
240	Switch the second tape control <b>offline</b> and set up the CE panel to perform multiple LWR (8B) commands with the above tape unit. Use Byte Cnt = FE0 Wrt Data and Go Down = FF0 Reset the tape control.	
241	The device switch logic card to be scoped is the one that had an active pin in Seq 218 or Seq 222.	
242	Is that pin still active?	Go to Seq 245
243	The Reset performed in Seq 240 reset the COMMITTED latch.	
244	There could still be a bad Reset signal.	
245	Set up an ALU2 COMPARE on address "1BF" (see 12–011).	
246	Set ROS Mode switch to Norm. Then RESET and START.	
247	Set Display Select switch to CE Reg, and Data Entry Select switch to Cmd1.	
248	Are lights flashing a hex 8B?	Go to Seq 250.
249	If lights are not flashing, the command sequence is not running. If flashing but not showing ''8B'', the tape control is not performing an LWR.	Go to Seq 46 to resolve.
250	Sync minus on A1U2U07 of the second tape control. A long sync lead may be needed.	
251	Scope the device switch logic card identified in Seq 218 or 222 for a 50 ns SET/RESET pulse on pin P07. Minimum up level is +4.5V. Minimum down level is +0.5V. Minimum duration is 40 ns.	
252	Does the pulse meet specifications in Seq 251?	Go to Seq 271.
253	The SET/RESET pulse comes from communicator card A2E2 in the tape control being tested.	
254	Is the Secondary Interface of the communicator card being used?	Go to Seq 260
255	Scope -SET/RESET PRIMARY (A2E2G13).	
256	Does the pulse meet specifications in Seq 251?	Go to Seq 271.
257	Is A2E2G13 a solid +4.5V?	Go to Seq 265.
258	Is A2E2G13 at a solid ground level?	Go to Seq 163
259	Is there a bad pulse?	Go to Seq 268.

Seq	Condition/Instruction	Action	1
260	Scope –RESET RESERVE SECONDARY (A2E2G04).		:
261	Does the pulse meet specifications in Seq 251?	Go to Seq 271.	:
262	Is A2E2G04 at a solid +4.5V level?	Go to Seq 265.	
263	Is A2E2G04 at a solid ground level?	Go to Seq 163.	
264	Is there just a bad pulse?	Go to Seq 268.	
265	Scope +RESET COMMITTED LATCH PLS (A2E2G10) for a MST pulse of 50 ns duration.		-
266	Is the pulse good?	Go to Seq 268.	┢
267	If not:	This is a tape control problem. Go to 00-010.	-
268	Check A2E2 for good socket connections. Change A2E2. Be sure the jumper is plugged correctly.		
269	Cable contacts may cause a poor pulse. For a 2x8 device switch, see XC700 Sheet 3 Chart D for cable routing. For a 3x8 or 4x8 device switch, see XC701 Sheet 3 Chart D for cable routing.		-
270	If not:	Go to Seq 250 and recheck your work.	ſ
271	Check the card socket contacts of the device switch logic card identified in Seqs 218 or 222 for good connections.	Go to see 250 and recheck your work.	
	<ul> <li>A. Replace the device switch logic card identified in Seqs 218 or 222, making sure the jumpers are plugged correctly.</li> <li>B. A COMMITTED latch may be turned on erroneously by communicator card A2D2 of the tape control that normally uses it. This can happen even when the tape control is not working with this tape unit</li> </ul>		
272	The BUSY/TACH line should be active		┝
L ! L	back to the operating tape control.		┝
273	On the device switch logic card you identified in Seq 65, scope pin G03 (BUSY TACH).		
274	Is pin G03 at +0.2V level?	Go to Seq 277	
275	Is pin G03 at a solid ground level?	Go to Seq 163.	┢
276	The device switch logic card identified in Seq 65 is failing.

#### HOW TO USE CHART A

#### Follow these steps:

From Seq 89	<b>9</b> :	
Step 1	Find the failing tape unit address in the column.	e left-hand
Step 2	Find the subsystem configuration in th	e top row.
Step 3	Go to block where they intersect.	
Step 4	Write down this information. Example: You have a 2x8 device switch, and TU on TCB. The box where they intersect lists FRU could cause device switching problems tape unit: LOGIC CARD OUTBOUND XPT CARD INBOUND XPT CARD DEVICE BUS OUT CABLE DEVICE BUS IN CABLE	s that
Step 5	Return to procedure at Seq 90.

# 18-033

### TAPE CONTROL CHANNEL INTERFACE PROBLEMS

Interface Control checks caused by the 3803 are primarily due to errors in ALU1 or ALU2. To check for this condition, run with the Control Check Stop switch ON and ALU1 in STOP mode. If an ALU1 Control Check occurs, refer to 13-000 for failure analysis: If the failure is not of this type and can be duplicated offline, refer to 12-000. (CAUTION, see Note 2.) To aid in online failure analysis, use program FRIEND. If possible, use the failing command sequence with timeout to restart on error.

Use the chart to locate the logic and cards associated with the failure type.

#### Most Probable Cause:

- 1. Interface Control Checks.
  - a. INTERFACE LOGIC
  - b. OUT TAG RECEIVERS
  - c. IN TAG DRIVERS
  - d. INITIAL SELECTION LOGIC
  - e. TIE-BREAKER LOGIC (Two-Channel Switch feature only)
  - f. TAG CABLES
- 2. Channel Data Checks.
  - a. BUS IN DRIVERS
  - b. BUS CABLES
- 3. Condition Code 3 (or unit not available).
  - a. BUS OUT RECEIVERS
  - b. ADDRESS GENERATION AND COMPARE
  - c. BUS CABLES
  - d. TIE BREAKER LOGIC (only if Two-Channel Switch feature is installed)

Numbers in () are card types which can be interchanged between interfaces to aid in isolating a failure, if Two-Channel Switch feature is installed.

**Note 1**: Removing this card may cause channel err before removing card.

**Note 2**: Trapping ALU errors online with the Control Check Switch ON may cause severe impact on customer operations. Make use of the channel retry feature on System 370 CPUs. Place the CPU in hard-stop mode before activating the Control Check switch. Use the hard-stop mode that ignores recoverable storage errors. When the ALU stops (1) obtain the required information from the CE panel, (2) turn OFF the Control Check switch, (3) switch the CPU to Process, and (4) start the CPU. This allows the channel retry hardware and software to recover. Recovery is only possible on intermittent ALU errors.

## 18-040

Note 1: Removing this card may cause channel errors, even with power off. Put processing unit in single cycle mode

## **EXTRA OR MISSING INTERRUPTS**

There are six cards that usually fix all interrupt problems. The symptoms (and normal fix) are listed below.

**Example:** If there are extra interrupts, the cards that are affected

are A2D2, A2R2.

Symptom/Most Probable Cause:

1. Missing Interrupts:

A2D2, A2N2, A2R2, A2Q2

2. Extra Interrupts:

A2D2, A2R2

Interrupts from the wrong device:
 A2T2

4. Lost Device End or a solid Device Busy:

A2D2 or the switch logic card (go to 18-010 for the switch).

5. Random device failures: A2E2

## TAPE CONTROL METERING PROBLEMS

#### From: START 1, 00-010, 00-040 **DESCRIPTION OF METERING:** The tape control usage meter should run when METERING OUT is active from either channel interface and that interface is Enabled. The tape unit usage meter should run whenever the tape control usage meter is running and the tape unit is away from load point. Most Probable Cause: 1. Only tape control usage meter failing: With EC733814—B2S2 (See CAUTION) Without EC733814-B2R2 (See CAUTION) 2 Only tape unit usage meter or meters failing: A2E2. 3. Tape control and tape unit usage meters failing: CHAN A - B2Q2(See CAUTION) CHAN B - B2P2 (See CAUTION) Both CHAN A and CHAN B - B2Q2 (see CAUTION) One tape unit failing: Α. T-A1L2 T-A1F2 В. С. T-A1K4 T-A1J2 D. CAUTION: Removing this card may cause channel errors, even with power off. Put processing unit in single cycle mode before removing card Always start with Seq 1 and follow the procedure in sequence unless directed otherwise. Remember to END all problem or maintenance calls by going to MAP 00-030. Seq Condition/Instruction Action Is the failing meter running all the time? Go to Seq 21. 1 2 Does the meter fail to run when only Go to Seq 29. interface B is active? 3 Are the tape unit meters running and the Go to Seq 14. tape control meter not running? 4 Is the tape control meter running and the Go to Seq 7. tape unit meters not running? Ensure that Channel A is enabled and Change B2Q2. (See CAUTION) 5 METERING OUT is active at the channel. Scope + IF METERING OUT CHAN A (B2Q2J13) (channel interface level). Is this line active? (+3 vdc) 6 If not: Go to ALD FC011 and follow line back to failing point. 7 Does the tape control have Selection Go to Seq 12. Logic? ### **ERROR CORRECTION SENSE ANALYSIS**

	: 15-100	e in sequence unless directed otherwise		
	amber to END all problem or maintenance of			
Seq	Condition/Instruction	Action		
1	Determine the failing OLT section and routine using the error printout. Go to the sequence number indicated:			
	Failure         Go to Seq           F0xxx         2           G01xx         6           G0231         9			
	G0232     14       G03xx     16       G05xx     23       H0xxx     25			
2	Is Byte 2 all ones ("FF")?	Change Y1J2. If not fixed, go to Seq 26.		
3	Is Byte 3 Bit 0 On?	Change Y1J2. If not fixed, go to Seq 26.		
4	Is Byte 9, Bit 0 On?	Change A1G2. If not fixed, go to Seq 26.		
5	If not:	Change A1K2. If not fixed, go to Seq 26.		
6	Is Byte 0, Bit 4 On?	Change A1K2. If not fixed, go to Seq 26.		
7	Was Data Check expected? (Check the mask on print.)	Change Y1N2. If not fixed, go to Seq 26.		
8	If not:	Change Y1K2/L2/M2. If not fixed, go to Seq 26.		
9	Is Byte 5, Bit 5 On?	Go to Seq 12.		
10	Is Byte 3, Bit 0 On?	Change in order:		
		1. Y1F2 2. Y1J2 If not fixed, go to Seq 26.		
11	If not:	Change in order:		
		1. Y1J2 2. Y1F2 3. Y1K2/L2/M2 If not fixed, go to Seq 26.		
12	Is Byte 3, Bit 2 On?	Change in order:		
		1. Y1P2 2. Y1N2 If not fixed, go to Seq 26.		

Seq	Condition/Instruction	Action
13	If not:	Change in order: 1. Y1N2 2. Y1K2/L2/M2 If not fixed, go to Seq 26.
14	Is Byte 3, Bit 0 On?	Change Y1N2. If not fixed, go to Seq 26.
15	If not:	Change in order: 1. Y1F2 2. Y1J2 If not fixed, go to Seq 26.
16	Is data check On?	Go to Seq 19.
17	Is 7-Track feature installed?	Change Y1D2. If not fixed, go to Seq 26.
18	If not:	Change Y1Q2. If not fixed, go to Seq 26.
19	Is Byte 5, Bit 4 On?	Change Y1K2/L2/M2. If not fixed, go to Seq 26.
20	Is Byte 3, Bit 0 On?	Change in order: 1. Y1K2/L2/M2 2. Y1F2 3. Y1G2 If not fixed, go to Seq 26.
21	Is Byte 3, Bit 2 On?	Change Y1K2/L2/M2. If not fixed, go to Seq 26.
22	If not:	Change in order: 1. Y1F2 2. Y1J2 If not fixed, go to Seq 26.
23	Is Byte 2, All Bits Off?	Change in order: 1. Y1K2/L2/M2 2. Y1P2 3. Y1N2 If not fixed, go to Seq 26.
24	If not:	Change Y1G2. If not fixed, go to Seq 26.
25	Go to Action Column.	Change Y1J2. If not fixed, go to Seq 26.
26	Refer to the OLT Users Guide (level 8 or above) for a description of the failing OLT function. Analyze the error printout using the OLT Users Guide as a reference. Can you define a failing mode (Command sequence, 6250 single or double error correction, Phase Encode mode, diagnostic read or write, etc.)?	Go to Seq 28.
27	If not:	Recheck symptoms.
28	Does the failing mode or sequence require a Diagnostic Mode Set or Set Diagnose command?	Go to Seq 34.

Seq	Condition/Instruction	Action
29	Is the failing mode 6250 single error correction?	Go to 17-600.
30	Is the failing mode 6250 double error correction?	Go to 17-600.
31	Can the failing mode be duplicated from the CE panel? Refer to MAP 12-000.	Go to 17-700.
32	Is this the second time through this sequence?	Go to 00-030.
33	If not:	Recheck symptoms. Go to Seq 26.
34	Does the Diagnostic Read in OLT Section F fail? The Diagnostic Read in 6250 mode disables error correction and transfers the ECC character to the channel with the data. Analyze the error printout of the actual and expected data to determine the failing track or tracks.	Utilize the loop-on-error option of the OLTs. Refer to the probe charts on 17-701 and the 6250 timing charts on 17-702, 17-703, 17-704 to determine the failure cause.
35	Does the Diagnostic Write in OLT Section G fail? This diagnostic checks Write Error Checking on a per-track basis in 6250 mode. Analyze the error printout to determine the failing track(s).	Utilize the loop-on-error option of the OLTs. Refer to the probe charts on 17-701 and the 6250 timing charts on 17-702, 17-703, 17-704 to determine the failure cause.
36	Does the Diagnostic Write in OLT Section H fail? This diagnostic checks Write Error Checking circuits in PE mode. Analyze the error printouts to determine the failing track(s).	Utilize the loop-on-error option of the OLTs. Refer to the probe charts on 17-701 and the timing charts on 17-705 to find the failing FRU.
37	If not:	Recheck symptoms.
