## SAFETY

## PERSONAL

The importance of personal safety cannot be overemphasized. To ensure personal safety and the
safety of co-workers, follow established safety practices and procedures at all times
Look for and obey the DANGER notices found in the maintenance documentation. All CEs must be familiar with the general safety practices and the procedures or artiticial respiration outlines in IBM Form $229-1264$. For convenience, this form is duplicated to the right.

## MACHINE

To protect machines from damage, turn off powe before removing or inserting circuit cards of components. Do not leave internal machine areas needlessly exposed, avoid shoring panel pins wh coping, and handle mache parts sautil, in e CAUTION notices found in maintenance documentation

## CE SAFETY PRACTICES

All Customer Engineers are expected to take every safery
precaution possible and observe the following safety prac. precaution possibie and observe the follo
tices while maintaining IBM equipment:
1.

1. You should not work alone under hazardous conditions
or around equioment with dangerous voltage. Always or around equipment with dangestous voltage.
advise your manager if you MUT work alone.
2. Remove all power, ac and dc, when removing or assem
bling maior components, working in inmediate areas of power supplies, performing mechanical inspection of pow er supplies, or installing changes in machine circuitry.
3. After turning off wall box power switch, lock it in the
Off position or tag it with a "Do Not Operate" tag, Form 229. 1266 . Pull power supoly cord whenever possible.
4. When it is absolutely necessary to work on equipment
having exposed operating mechanical parts or exposed live electrical circuirry anywhere in the machine, observe
he following precautions:
a. Another person familiar with power off controls must
be in immediate vicinity.
b. Do not wear rings,
c. Use only insulated pliers and screverivers.
d. Keep one hand in pocket.
e. When using test instruments, be certain capacity are used. Avoid contacting ground potential Imetal floor strips. chased locally if neecessary
5. Wear safety glasses when:
a. Using a hammer to drive pins, riveting staking, etc.
b. Power or hand drilling, reaming, grinding, etc.

Using spring hooks, attaching springs.
Soldering, wire cütring, removing steel 'bands e. cleanis. etc.

Follow special satem ener - THEY ARE YOUR EYES
ized tasks, such as as handinting cathonode ray putbes and extrememel

. Do not use solvents, chemicals, greases, or oils that have
not been approved by 1 BM
. Avoid using tools or test equipment that have not been ap
9. Replace worn or broken tools and test equipment.
10. Lift by standing or pushing up with stronger leg muscles Lift by standing or pushing up with stronger leg muscles -
this takes strain off back muscles. Do onot lift any equip. this takes strain off back muscles. D
ment or parts weighing over 60 pound
After maintenance, restore all safety devices, such as guard
Each Customer Engineer is re no action on his part renders pro
customer personnel to hazards.
13. Place removed machine covers in a safe out-of-the.wav
place where no one can trip over them.
14. Ensure that all machine covers are in place before returning
5. Always place CE Eool kit awav from walk areas where no
one can trip over it for example, under desk or table.
16. Avoid touching moving mechanical parts when Iubricating.

When using strobosccope, do not touch ANYTHING -
When using strob
18. Avoid wearing loose clothing that may be caught in ma-
chinerv. Shirt sieeves must be left buttoned or rolled abo
the elbow.
the elbow.
9. Ties must be tucked in shirt or have a tie clasp (preferably
nonconductive) approximately 3 inches from end. Tie chains are not recommended.
2. Before starting equipment, make certain fellow CEE and

1. Maintain good housekeeping in area of machine while frming and after completing maintenance.

## ARTIFICIAL RESPIRATION

General Considerations

1. Start Immediately - Seconds Count
Do not move victim unless absold

Do not move victim noless absolutely neesescary to remove trom danger. Do not wait arsoort tor heelossory too ree to
toosen clothing, warm the victim, or apply stimulants.
2. Check Mouth for Obstructions
3. Loosen Clothing - Ke
3. Loosen Cloth ing - Keep Victim Warm
Take care of these items stret victim is breathing bv him.
self or when help is
self or when help is available.
4. Remain in Position
Aftrvictim revives, be ready to resume respiration it
5. Call a Doctor
5. Have someone summon medical aid.
6. Don't Give Up

Continue without interruption until victim is breathing
without help or is certainly dead

## Rescue Breathing for Adults

1. Place victim on his back immediatelv.
2. Clear throat of water, food, or foreign
3. Tilt head back to open air passage.
4. Lift iaw uo to keep tongue out of
5. Lift iaw up to keep tongue out of a air passage.
6. Pinch nostrils to prevent air leakage when you
7. Blow until you see chest rise.
8. Remove vour lips and allow lungs to emptr.
9. Listen for snoring and gurglings - signs of throat obstruc.
10. Repeet mouth to mouth breathing 10.20 times a minute.
$\underset{\substack{T h u m b ~ a n d ~ \\ \text { finger positions }}}{\substack{\text { n }}}$ T

## BASIC SUBSYSTEM

The IBM 3803-2/3420 Magnetic Tape Subsystem consists of an IBM 3803 Model 2 Tape Control and one or more IBM 3420 Magnetic Tape Units. The 3420 tape units are available in six models with tape speeds of (1905/317,5/508 ches per for M (ips) and 4, 5 and 6, and 7 and 8 , respectively.

The 3803 Model 2 operates in 6250 bpi and 1600 bp modes.
A 3803 tape control without any switching features controls up to eight 3420 tape units ( $1 \times 8$ configuration also called selection logic).
The 3803 command set, status responses, and basic sense data are compatible with those used by IBM 2400 -series tape subsystems. However, there are some minor programming differences. For example:

1. The number of sense bytes and contents of those bytes differ from those used by 2400 -series subsystems.
2. All commands not shown on 40-005 and 40-008 set COMMAND REJECT in the sense information which, in turn, sets Unit Check in the status byte, indicating to the system that something is wrong.
3. A sense command must be issued after an error condition sets Unit Check in the unit status byte. In most instances, non-time dependent programs that operate successfully on an IBM 2400-series tape subsystem will operate correctly on an IBM 3803-2/3420 subsystem.

## 3420 TAPE UNIT

Information presented in this section applies to all models of the tape unit
With compatible features, 3420 Models 3, 5, and 7 can be attached to the 3803-2 without modification.

3803/3420 Subsystem Schematic

## AUTOMATIC THREADING

A write reel latch secures the file reel to the reel hub automatically. When the operator places a file reel or cartridge on the reel hub and presses LOAD/REWIND, the power window closes, the write reel latch secures the file reel to the hub, and tape is automatically positioned at load point without further operator action.

## BM Easy load cartridge

When used with a solid-flange tape reel (standard IBM 10.5 inch), the optional, IBM Easy Load Cartridge reduces tape handling and helps prevent tape contamination or physical damage
During a load operation, if the first threading sequence is unsuccessful, tape is rewound into the cartridge and another attempt is made.

## TAPE TRANSPORT

A single direct-drive capstan moves tape forward or backward. Air bearings reduce friction and tape wear since the oxide (recording) surface of the tape contacts only the read/write head and the tape cleaner. Short, apered vacuum columns greatly reduce tape inertia when starting and stopping tape. The tapered column nd single, direct-drive capstan start and stop tape quickly and smoothly.

## REWINDING

Tape remains in the vacuum columns during rewind operations. Rewind ends when a photocell senses a reflective marker on
binning-of-tape (load point) reflective marker on tape.

During a rewind unload operation, tape is rewound completely onto the file reel. The tape unit is left in unloaded status, with the tape reel latch unlocked and the window open, allowing the operator to remove the file reel.

## READ BACK CHECKING

A two-gap read/write head with 0.150 inch ( $3,81 \mathrm{~mm}$ ) between read and write gaps allows read back checking during a write operation. Moving forward ape passes first the write gap, then the read gap

## FULL-WIDTH ERASURE

An erase head applies a strong magnetic field that erases the entire width of tape during write operations Full-width erasure prevents interchangeability problem when tape is written on one tape unit and read on another; it also reduces the chances of leaving extraneous bits in interblock gaps or skip areas.
During a write, write tape mark, or erase operation, the ape unit monitors the erase head operation. On a 3420 Model 4, 6, or 8, an erase head failure drops tape unit ready status and halts tape motion. On a 3420 Mode 3 5, or 7, an erase head failure sets Unit Check, but does not drop ready status.

## FILE PROTECTION

A write enable ring must be present in the file reel when writing. To avoid destroying information on tape, he write enable ring is removed. A reel without the ing is "file-protected". FILE PROTECT turns on when the reel is mounted and no writing can occur

## 3420 MODELS 4, 6, AND 8

Models 4, 6, and 8 tape units can write and read 6250 bpi tapes with 0.3 -inch interblock gaps. Nominal data rates are 470, 780, and 1250 kilobytes per second at 6250 bpi.

A tape cleaning mechanism is added
3420 Models 3, 5 , and 7 can be converted in the field to Models 4, 6, and 8 .

## OPER-SUBSYSTEM CONCEPTS (Cont'd)

## RECORDING METHODS

## 6250 BP

In 6250 bpi mode, 6250 data bytes per inch ( 246 data bytes per mm ) are recorded in nine parallel tracks on tape. 6250 bpi tapes are written with an identification burst (ID burst) in track 1 at load point. The ID burst is ollowed by a control burst and a 0.3 -inch ( $7,62 \mathrm{~mm}$ ) IBG before a data block is written.
6250 bpi is a basic density on 3803 Model 2 and on 3420 Models 4, 6, and 8

## 6250 BPI ERROR CORRECTION

The 6250 bpi format employs an
error-correcting/detecting code capable of correcting all single-track errors on the strength of the code alone and correcting all double-track errors with the aid of track pointers. Pointers such as phase error and incorrect pattern are indications of questionable data. If the errors fall outside the code capability, Data Check and Unit Check are set and Error Recovery Procedures (ERPs) are invoked

## 1600 BPI

In 1600 bpi mode, 1600 bytes per inch ( 63 bytes per mm ) are recorded in nine parallel tracks on tape. The data format uses eight of the nine bits for data, the ninth is a parity bit. Data is recorded in odd parity. The eight bits of one byte can represent an alphabetic character, zoned decimal digit, two decimal digits (packed), a special character, or eight binary bits.
1600 bpi is a basic density on the 3803 Model 2 and on 3420 Models 3, 5 , and 7, and a feature on 3420 Models 4,6 , and 8.

## NINE-TRACK NRZI

In nine-track NRZI, data is recorded at 800 bpi ( 31,5 bytes per mm ) in nine parallel tracks on tape. Data representation is the same as for 1600 bpi PE. For nine-track NRZI operation, the dual density feature is required on a Model 3,5, or 7 tape unit and the nine-track NRZI feature is required on a 3803 Model 2

## SEVEN-TRACK NRZI

In seven-track NRZI mode, data is recorded at 200 , 556 , or 800 bpi ( $7,6 / 21,9 / 31,5$ bytes per mm ). The data format uses six of the seven bits for data and the either odd or paven parity. The. Data is recorded in can represent a BCD character or six binary bits. For seven-track NRZI operation a sen brack bits. For required on both a 3420 Model 3, 5, 7 and on 803-2

## INTERBLOCK GAP

An interblock gap (IBG) is the erased section of tape used to indicate the end of a block or record. Interblock gaps are
6250 bpi:
0.3 inch ( $7,6 \mathrm{~mm}$ ) nominal.

Nine-track
PE/NRZI:
0.6 inch ( $15,2 \mathrm{~mm}$ ) nominal; 0.5 inch ( $12,7 \mathrm{~mm}$ ) minimum.

Seven-track:
0.75 inch ( $19,05 \mathrm{~mm}$ ) nominal; 0.68 inch ( $17,27 \mathrm{~mm}$ ) minimum.

## MAGNETIC TAPE AND REELS

Most tape volumes that operate satisfactorily on 3420 Models 3, 5, and 7 will operate with equal or better read/write reliability for an equivalent number of bytes transferred on 3420 Models 4, 6, or 8. Tape must conform to IBM Half-Inch Tape Specifications, GA32-0006

## 3803 MODEL 2 TAPE CONTROL

The 3803 Model 2 Tape Control connects to the I/O interface of an IBM System/360 Model 50 and above (by RPQ only) or an IBM System/370, Model 135 and above. The tape control has a CE panel, two microprogram control sections, a read section, a write section, and a channel buffer section.
Note: "I/O Interface" refers to a set of lines over which the tape control and system channel exchange control and data signals. Interface lines and operation are described in IBM System/360 and System/370 I/O interface, Channel to Control Unit, Original Equipment Manufacturers' Information, Order Number GA22-6974. The 3803 may exceed an interface signal sequence of 32 microseconds, and may produce a worst case interface signal sequence of up to 50 microseconds on some instructions when in seven-track mode with the two-channel switch feature installed.
i he 3803 Model 2 operates at 6250 or 1600 bpi. The 3803 Model 2 with appropriate features can process bpi NRZI tape when used with 3420 Model 3, 5, and 7 tape units having the companion NRZI features
All data transfers are in burst mode. The tape control executes one command on one tape unit at a time. The tape control parity checks each data byte transferred bperations, bus out parity is ched. Ond parity perations, bus out parity is checked and parity is tape unit. On read operations, tape control parity is ape und. Ond ope if ns, tape cont paris placed on the I/O interface On sense operations, correct parity is supplied for each byte. Parity is a checked on command bytes
1/O commands issued by the channel are executed with microprograms resident in two independent read-only storage (ROS) units. One ROS unit controls
communication lines to the channel, while the other
ROS unit controls communication lines to the tape unit

## ADDRESSING

Every tape unit has a unique device address, which consists of a channel address, a tape control address, and a tape unit address. Pluggable jumpers assign the tape control address when the system is installed. The tape control has separate device interface connectors for each tape unit address. A tape unit's address is determined by the tape control connector to which it is attached. There is no address decoding at the tape unit or device interface level.

## METERING

A usage meter is installed in the tape control and in each tape unit. The tape control's usage meter records elapsed time whenever the METERING OUT line is active and the tape control is in online status (Enabled) A tape unit's usage meter records elapsed time when the tape control METERING OUT line is active, tape unit is loaded, and the tape is not at load point. METERING IN is used by the central processing unit (CPU) metering circuits; this line is active from the time a command is accepted by the tape control until Device End is generated for that command. See IBM System/360 and System/370 I/O Interface: Channel to Control Unit OEMI, Order Number GA22-6974.

## ENABLE/DISABLE SWITCH

This switch allows the tape control and all attached tape units to be put online or taken offline so a customer engineer can use the CE panel switches and indicators to diagnose errors. Whenever the tape control is placed in offline status (Disabled), the usage meters in the tape control and all attached tape units are prevented from running. When the two-channel switch feature is installed, a second Enable/Disable switch is provided on the 3803.

## POWER ON/OFF SEQUENCING

Normal power on/power off sequencing for the $3803-2 / 3420$ tape subsystem is controlled by system power interlock circuits. Maintenance activities may necessitate dropping power in the tape control and attached tape units while power remains on in the
system. To take the subsystem offline, see 12-010.

## 3803-2/3420 CONFIGURATIONS

Operation with Model $4 / 6 / 8$ Tape Units (6250 or 1600 bpi Mode and Models $3 / 5 / 71600$ bpi Tape Units

## 3803 MODEL 2 FEATURES

Features available on a 3803 Model 2 are nine-track NRZI, seven-track (NRZI), two-channel switch, and device switch. For switch feature descriptions, see Section 58-005 through 58-111.

## NINE-TRACK NRZI

The nine-track NRZI feature, available on the 3803 Model 2, permits operation in nine-track NRZI mode. Nodel 2, permits operation in nine-track NRZI mode. or 7 Tape Unit with the dual density feature.

## SEVEN-TRACK NRZI

The seven-track feature permits operation in seven-track NRZI mode. Seven-track operation with a 3803 Model 2 is at $800 / 556 / 200$ bpi. The seven-track feature contains both the data translator and data converter for seven-track operations. The operation is similar to that of the 3803-1 with the seven-track feature. For seven-track operation, the seven-track feature on a 3420 Model 3, 5, or 7 and on the 3803 Model 2 is required. The nine-track NRZI feature is a prerequisite for the seven-track feature on the 3803 Model 2.
Writing a tape with the translator on causes eight-bit bytes from the I/O interface to be written on tape as six-bit BCD characters; reading such a tape causes six-bit BCD characters to be translated into their EBCDIC equivalents. When using the translator, data rates are not changed and there are no changes in the tape unit's operation.
Writing a tape with the data converter on causes four tape characters ( 24 data bits) to be written for every three storage bytes ( 24 data bits); reading such a tape reverses the process by converting four tape characters into three storage bytes. When operating with the data converter on, the data transfer rate is 75 percent of the rate with data converter off.

DENSITY FEATURE COMBINATIONS

| Density (bpi) (Note 1) | 3803-1 | 3803-2 | 3420-3/5/7 <br> (Note 2) | $\begin{gathered} \text { 3420-4/6/8 } \\ \text { (Note 3) } \\ \hline \end{gathered}$ |

## COMMANDS AND INSTRUCTIONS

## COMMANDS

Commands executed by this subsystem fall into one of the following three categories

1. Burst Commands
2. Motion Control Commands
3. Non-Motion Control Commands

The table on this page and the one on 40-008 list the subsystem commands and command codes. Commands not listed will set COMMAND REJECT

Programming Note: The 3803/3420 subsystem has no interlocking to prevent improper sequencing of writeand read-type operations that may result in writing extraneous bits or leaving partial blocks on tape. Avoiding these improper sequences is a program responsibility.
Avoid the following two basic sequences

1. A write-type operation after a forward read-type operation except:
a. When the block or Tape Mark (TM) read is known to be followed by a TM. A tape mark is a special block used to separate files.
b. When the block or TM read is known to have been followed by erase record gap (ERG) or is known to have been the last block written before a backward operation

## For example: R R W* avoid.

W B R W* allowed
2. A read forward-type operation following write-type perations.
For example: R B W R* avoid.

## W B R R* avoid.

W indicates a write-type operation: write, write TM, or (ERG).
$\mathbf{R}$ indicates a forward read-type operation: read forward, forward space block, or forward space file.

B indicates a backward read-type operation: read backward, backspace block, or backspace file.
indicates the logical record on which problem may occur.
Because it may be difficult or impossible to ensure the above safe situations, a write after read forward sequence should be used only in applications where strict control of format and command sequence exists. Write is allowable following a backspace. Assume the following tape format with labels where * is used to denote a TM:

VOL HDR * DATA SET * EOF * HDR * DATA SET * EOF **
A rewrite of the last data set involves the following safe and proper sequence. After processing the next to header (HDR) label of the last data set backspace write a new HDR, and rewrite the data set If a new data set is being added the read forward verifies the second consecutive TM, and thus, the true end of a data set on this tape. A backspace, write new HDR etc., completes the sequence.

| Motion Control Commands |  | ${ }_{1}$ | 2 m | 44 | ${ }_{5}$ |  |  | Hex |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Backspace File |  | 0 | 10 | 1 | 1 | 1 | 1 | 2 F |
| Forward Space Block | 0 | 0 | 11 | 0 | 1 | 1 | 1 | 37 |
| Forward Space File | 0 | 0 | 11 | 1 | 1 | 1 | 1 | 3 F |
| Data Security Erase | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 97 |

## BURST COMMANDS

Burst commands transfer data across the channel/tape control interface. Channel End and Device End are signaled when the operation is complete (ending status).
the burst commands are.
Write
Read Forward
Read
Sense Reserve
Sense Release
Request Track-In-Erro
Loop Write-To-Read (maintenance aid*)
Set Diagnose (maintenance aid*)

* Diagnostic programs issue maintenance aid commands via start I/Os (SIOs) that are op-codes in the Channel Command Word (CCW)

## WRITE

Write records data on tape as it moves forward and creates an interblock gap (IBG) at the end of each block. The tape control checks the parity of each data byte received from the I/O interface

## READ FORWARD

Read Forward sets the tape unit to forward read status As the tape moves, data is read until the read head detects the next IBG. The tape control checks and, if necessary and possible, corrects the bits of each byte ransferred to the I/O interface. Sensing a tape mark ets Unit Exception with Channel End and Device End in the Unit Status byte.

READ BACKWARD
Read Backward sets the tape unit to backward read tatus. The operation of the command is similar to Read Forward, except that the 7-track NRZI data converter mode cannot be used. Data flow and controls are the same as in Read Forward. A Read Backward, given at load point or into load point, sets Unit Check. The tape unit remains in backward status at the end of a Read Backward command.

## SENSE

Sense transfers the sense bytes to channel. There are 24 bytes of sense data available. The CCW specifies the number of sense bytes to be transferred and the tarting storage address. The information transferred ncludes unusual conditions associated with the last peration and provides details about the current conditions present in the tape control and tape unit. A sense command addressed to a tape unit that is not ready will be executed.

## SENSE RESERVE

Sense Reserve reserves the addressed tape control for the channel issuing this command. The tape control will remain reserved for the channel until either

- A Sense Release command is issued from the reserving channel, or
A system reset occurs
Attempting to select a tape control that is reserved to another channel results in a Control Unit Busy indication. The Sense Reserve command should only be issued by the Control Program.

## OPER-TAPE COMMANDS (Cont'd)

## SENSE RELEASE

Sense Release releases the reserved tape control so it is available to either channel. The Sense Release command should only be issued by the control program.
Programming Note: Sense Reserve and Sense Release commands can only be used on subsystems having the two-channel switch feature. If these commands are issued to a tape control without this feature, COMMAND REJECT results. When using these commands, they must be the first command in a chain or COMMAND REJECT results
The Sense Reserve and Sense Release commands are not supported by IBM Operating Systems.

## REQUEST TRACK-IN-ERROR (REQUEST TIE)

Request TIE returns to the tape control a data byte containing track-in-error information for 9-track and sensing level information for 7 -track tape units. This information is transmitted to the channel in sense byte 2 on a Sense command following a Read, Read Backward, Write, or Loop Write to Read command When issued following a 6250 bpi or PE operation, Request TIE is treated as a No Operation (NOP Reset Sense
When issued following a 9-track NRZI read operation, Request TIE either:

- Enables the tape control to perform a correction read operation if the data byte contains a single bit, or
- Does not enable the tape control to perform a bits 6 and read operation if the data byte contains bits 6 and 7, which indicate an uncorrectable error When issued following a 7 -track read operation, the Request TIE byte controls the read clipping level in the following sequence:

Second attempt-Middle Leve
Third attempt-Low Level
Fourth attempt-High Level
Clipping levels are cyclically altered in this way as long as read attempts result in Vertical Redundancy Check (VRC) errors

## LOOP WRITE-TO-READ (LWR)

Loop Write-to-Read checks the tape control and tape unit data and control paths without moving tape. in 6250 or 1600 bpi mode, LWR writes and error checks the record. In NRZI mode, LWR writes the record but checks only for Write Trigger VRC errors. Read errors will occur during the NRZI operation but will be reset by ALU2 when the LWR operation is completed.
On 9-track 3420 tape units, a LWR command issued at beginning-of-tape (BOT) is executed in 1600 bpi mode Elsewhere on tape, LWR is executed in the current operating mode of the tape unit.
LWR does not require the tape unit to be in write status, but the tape unit must be ready. Execution of an LWR does not change the status of the tape unit. An LWR performed from the processing unit uses the same data path as a Write command

## SET DIAGNOSE '4B'

Set Diagnose is used to call microdiagnostic routines Bytes are transferred from channel to the tape contro to modify the operation of succeeding commands in the chain.

## FLAG BYTE 1

| Bit | Write | Read |
| :---: | :--- | :--- |
| 0 | Diagnostic Write | N/A |
| 1 | N/A | IBG Measure |
| 2 | Inhibit Postamble | Read Access |
| 3 | Var Go-down Time | Var Go-down Time |
| 4 | Inhibit Preamble | N/A |
| 5 | LWR | DMR |
| 6 | TUBO Mask | N/A |
| 7 | Change Direction | Change Direction |

## Diagnostic Write

Performs the same function as the 'OB' command.
PE - causes writing to be inhibited in any track when the write data contains successive one bits.
NRZI - 9 track - Inhibits writing P bits 7 track - Inhibits writing $C$ bits.

## Inhibit Postamble

Prevents writing the last 39 zeros of the postamble. The ending all-ones marker and the first zero is written

## Variable Go-down Time

Two bytes (flag bytes 3 and 4) are sent to the tape control unit. These bytes are used to control the wait time before starting the next operation in the chain following the Set Diagnostic (48) command.

## Count values are:

103.15 Microseconds to decrement one count.

27 Milliseconds to decrement the low order counter 256 (' FF ') counts and cause one decrement of the high order count

## Inhibit Preamble

Prevents writing the first 39 zeros of the preamble. The last (40th) zero and the beginning all-ones marker is written.
Loop Write-To-Read
Write data is sent to the tape unit. In the MST board is gated to the read circuits and then returned to the tape control unit for read checking.

## Set TUBO Mask

Flag byte 3 is used as a mask to control the tape unit Bus Out. Any bit on in flag byte 3 causes that tape unit Bus Out bit to be held active, and thus prevents the tape unit from writing data for that specific bit.

## Change Direction

Change Direction allows the following word (CCW) chain to progress through turnaround, if necessary, and up to the point of activating the Move line to the tape unit. At this point, the operation is terminated. The tape unit is lef in forward or bat on status, depending on Direction instruction.

## FLAG BYTE 2

| Bit | Description |
| :---: | :--- |
| 0 | Block Data Check |
| 1 | N/A |
| 2 | Block Interrupts |
| 3 | Force Control Unit Busy |
| $4-7$ | N/A |

## FLAG BYTE 3 (OPTIONS

DMR
Go-Up Time in tack pulses
GDT Hi order byte of go-down count

TUBO Mask Byte used to mask TU Bus Out

## FLAG BYTE 4 (OPTIONS

DMR Go-down time measure count equivalent to tach pulses. No tach pulse when tape is not moving

GDT Lo order byte of go-down count.

## MOTION CONTROL COMMANDS

Motion control commands move tape but do not transfer information across the channel/tape control interface.
All motion control commands operate as follows

1. Channel End is signaled when the command is accepted (initial status)
2. For commands other than Rewind/Unload, device end is signaled when the operation is completed (ending status).
3. The tape control responds with BUSY if the tape As antrol is addressed while executing the command. As a result, the 3803 is obligated to prese BUSY as soon as the current operation is complete.
Note: For Rewind/Unload, Channel End is signaled in initial status, and Device End, Control Unit End, and Unit Check are signaled in an interrupt status cycle after the command becomes effective at the tape unit Device End is signaled again when the operator reloads tape, presses START, and the tape unit goes from not-ready to ready providing the tape control has not been offline in the interim.
Motion control commands are
Rewind
Rewind/Unload
Erase Gap
Write Tape Mark
Backspace Block
Backspace File
Forward Space Block
Forward Space File
Data Security Erase

## REWIND (REW)

Rewind causes the selected tape unit to rewind tape to load point.

REWIND UNLOAD (RUN)
Rewind Unload causes the selected tape unit to rewind tape to load point, removes tape from the columns, finishes winding tape onto the right reel, closes the cartridge (if used), and opens the window.

## ERASE RECORD GAP (ERG)

Erase Record Gap causes the selected tape unit to move tape forward and erase tape as follows:

|  | Single ERG | Successive ERGs |
| :--- | :--- | :--- |
| 6250 bpi | 3.75 in. $(95,3 \mathrm{~mm})$ | $3.45 \mathrm{in} .(87,6 \mathrm{~mm})$ |
| 1800 bpi and <br> 800 bpi 9 -track | 4.2 in. $(106,7 \mathrm{~mm})$ | $3.6 \mathrm{in} .(91.4 \mathrm{~mm})$ |
| 7 -track | 4.5 in. $(114,3 \mathrm{~mm})$ | 3.75 in. $(95,3 \mathrm{~mm})$ |

## WRITE TAPE MARK (WTM)

Write Tape Mark causes the selected tape unit to move tape forward and write a tape mark block

At 6250 and 1600 bpi, a WTM causes the subsystem to write a tape mark preceded by an Erase record gap.
Data Check, Equipment Check, and Unit Check can be set during a Write Tape Mark (WTM) operation. Attempting to write a tape mark on a file-protected tape unit sets COMMAND REJECT.

## BACKSPACE BLOCK (BSB)

Backspace Block causes tape to move backward to the next interblock gap or to load point, whichever comes first. No data bytes are transferred. Channel End is signaled when the command is accepted. Device End is signaled at the next interblock gap or load point. Sensing a tape mark sets Unit Exception, with Device End in the status byte. Backspacing into or at load point sets Unit Check with Device End in the status byte. The tape unit remains in backward status.

## BACKSPACE FILE (BSF)

Backspace File causes the selected tape unit to move tape backward to the interblock gap on the load point side of a tape mark, or to load point, whichever comes first. No data bytes are transferred. Unit Exception is not set when tape mark is sensed.
Backspacing into or at load point sets Unit Check with Device End in the status byte. Device End is signaled at the completion of the operation. The tape unit remains in backward status.

## FORWARD SPACE BLOCK (FSB)

Forward Space Block causes the selected tape unit to move tape forward to the next interblock gap. Initial status contains Channel End. Sensing a tape mark sets Unit Exception, with Device End in the status byte.

## FORWARD SPACE FILE (FSF

Forward Space File causes the selected tape unit to move tape forward to the interblock gap beyond the status contains Channel End Device End is signaled the completion of the operation Sensing the tape mark does not set the Unit Exception bit.
Programming Note: The tape control responds with Control Unit Busy sequence while performing an ERG, WTM, BSB, BSF, FSB, or FSF operation.

## DATA SECURITY ERASE (DSE)

Data Security Erase causes the selected tape unit to erase tape from the point at which the operation is initiated until the end-of-tape marker is sensed.
The DSE command is accepted by the tape control only when chained immediately following an Erase Gap command. Receipt of this command under any other condition results in COMMAND REJECT. If the command is accepted, initial status contains Channel End, and Device End is signaled when the operation is omple. An atempt to erase a fle-protected tape sets COMAND REJECT. Uni Exceplion never occurs end of tape (EOT) causes an imma liate ending equence. The tape control does not remain bus initial selection. An attempt to select the tape while executing a DSE results in busy status.

During DSE execution, the tape unit monitors erase head current to ensure that tape is erased. If erase head failure is detected, the operation is terminated by dropping TAPE UNIT READY. Device End and Unit Check are issued as a result of dropping READY. At he completion of a DSE, the tape control presents Device End to channel.

Programming Note: If the tape unit drops ready or ails logically during DSE, the ending status containing Device End and sense byte 7, bit 4 (Erase Head Failure) is also set.

Device End is signaled when the EOT marker is sensed during a normal DSE completion. However, a sense command should be performed to assure EOT was reached. Upon completion of the DSE, the operating program must issue sufficient erase gap commands to ensure erasure of any data written beyond the EOT marker. Issuing 14 erase gap commands, which erase about 4 feet $(1,22 m)$ of tape, is generally sufficient. The channel must be enabled for interrupts to detect a Unit Check condition due to manual intervention. When Device End is signaled, a sense command should be performed to ensure the tape unit reached EOT.
The Data Security Erase command is not currently supported by IBM Operating Systems. DOS supports DSE via a Magnetic Tape Command (MTC).

## NON-MOTION CONTROL COMMANDS

Non-motion control commands do not move tape and do not transfer data across the channel/tape control interface.
Channel End and Device End are signaled when
non-motion control commands are accepted (initial status).

Non-motion control commands are:
No-Operation
Mode Set 1
Mode Set 2
Diagnostic Mode Set (maintenance aid)

## NO-OPERATION (NOP)

NOP performs no function in the tape control or tape unit, and does not transmit data or move tape. NOP does not reset tape control sense data.
Programming Note: Placing a NOP command at the end of a series of chained commands delays channel disconnect from the tape control until the NOP is executed. Indiscriminate use of this command delays the channel program, and may contribute to a channel overload condition.

## MODE SET 1 (MS 1)

Mode Set 1 commands sent to tape controls with the 7 -track NRZI feature establish an operating mode for succeeding 7 -track NRZI operations. Bits 0 and 1 control density (200/556/800 bpi) and bits 2, 3, and 4 and translator (on or off) circuits in the ter (on or of and translator (on or off) circuits in the tape control. See chart on this page.

A Mode Set 1 command affects operation of all 7-track tape units attached to the tape control. Unless reset, the tape control retains its mode setting until it receives another Mode Set command.

## MODE SET 2 (MS 2)

Mode Set 2 commands sent to a 3803 Model 2, set the operating mode for succeeding write-type operations. Modes are: 6250 bpi, 1600 bpi PE, or 800 bpi nine-track NRZI. Unless reset, the tape control retains its mode setting until it receives another Mode Set command.

## DIAGNOSTIC MODE SET (DMS)

DMS causes an artificial signal-loss condition that checks read and write error detection circuits.

- At 6250 bpi, track $P$ is made all zeros and the
program supplies the error correcting code as part of the data.
- At 6250 bpi Diagnostic Read inhibits single- and double-track error corr check characters to channel with data.
- At 1600 bpi, whenever write data contains successive one bits in any track, writing in that track is inhibited until the last one bit is reached.
- In 9-track NRZI mode, no bits are written in track $P$
- In 7-track NRZI mode, no bits are written in track C

A Diagnostic Mode Set command affects only operations for the command chain in which it is issued.

Mode Set Commands

| Set Density |  |  | Parity |  | Data Converter |  | Translator |  | Command Byte |  |  |  |  |  |  |  | Hex |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 200 | 556 | 800 | Odd | Even | On | Off | On | Off | 0 | 1 | 2 | 3 | 4 | 5 | 6 |  |  |
| Mode Set 1 (7-Track) (See Note) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| x |  |  | $\times$ |  | x |  |  | x | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 13 |
| x |  |  |  | $\times$ |  | x |  | x | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 23 |
| $x$ |  |  |  | x |  | $x$ | x |  | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 2 B |
| x |  |  | x |  |  | x |  | $\times$ | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 33 |
| x |  |  | $\times$ |  |  | x | x |  | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 38 |
|  | x |  | x |  | x |  |  | $\times$ | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 53 |
|  | x |  |  | x |  | x |  | x | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 63 |
|  | x |  |  | x |  | $x$ | x |  | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 6B |
|  | $x$ |  | $x$ |  |  | $x$ |  | $\times$ | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 73 |
|  | x |  | x |  |  | $\times$ | $\times$ |  | 0 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 78 |
|  |  | x | x |  | x |  |  | $\times$ | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 93 |
|  |  | x |  | x |  | x |  | $\times$ | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | A3 |
|  |  | x |  | x |  | $x$ | x |  | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | AB |
|  |  | $x$ | $x$ |  |  | $x$ |  | $\times$ | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | B3 |
|  |  | x | x |  |  | x | x |  | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | BB |
| Mode Set 2 (9-Track) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 800 | 1600 | 6250 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  | x |  |  |  |  |  |  | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | D3 |
|  | x |  |  |  |  |  |  |  | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | C3 |
| x |  |  |  |  |  |  |  |  | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | Св |
| Note: Seven-track Mode Set 1 commands are treated as 'NOP reset sense' when issued to a tape control without the seven-track NRZI compatibility feature. |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## I/O INSTRUCTIONS

In addition to initiating one of the I/O operations by means of the Start I/O (SIO) instruction, the program can cause certain actions at the tape control by using the Test I/O and Halt I/O instructions.

## TEST I/O

A Test I/O instruction performed by the Central Processing Unit (CPU), causes the status byte for the selected tape unit to be sent to the channel for analysis. No actual operation is performed.
Note: A Test I/O command issued to a not ready tape unit results in a contingent connection on tape control units with the two-channel switch.

## HALT I/O

A Halt I/O instruction causes data transfer to stop. The ape control disconnects from the channel and
proceeds independently to the completion of the
operation. When the operation is completed, the tape control tries to re-establish connection with the channe to transfer ending status. If addressed while
completing the operation, the tape control returns a BUSY signal.
If a Halt I/O instruction is executed after STATUS IN and before tape motion is started during a Write or Read operation, the operation is canceled, and Channel End, Device End, Unit Check, and Data Check are generated.

## ROS 1 TRAP CONDITIONS (Cont'd)

Both hardware and microprograms generate resets.
Types of resets are General, Selective, and Machine.
[1] GENERAL RESET resets all flags, stats, and reserve bits that apply to the selecting interface.
[2] SELECTIVE RESET performs the same functions except the Control Unit Reserve and Hold Interface bits are not reset
[3] POWER ON RESET and CE panel resets generate MACHINE RESET. Turning power on and pressing RESET both generate POWER ON RESET. POWER ON RESET clears some LSRs and initiates INTERFACE CHECKOUT. Channel outbound tags are checked to ensure all are inactive and all inbound tags except OP IN are activated. Contents of the CHANNEL BUS IN register are sent to CHANNEL BUS OUT.
[4] INITIAL SELECTION AB CE traps ROS 1 to 000 at each selection of the tape control.
[5] LOCK ROS 1 IC traps ROS 1 to 000 when an ALU
1 hardware error occurs.
MP2 is activated for the proper reset after Stat B
has been set on or off to reset only the selecting interface. CONTROL UNIT BUSY is activated for the duration of the reset and is deactivated at completion of MP2 reset.
If MP2 has hardware errors, the tape control "hangs up" with BUSY active and loops on a trap address.
fill steps are completed correctly, the reset is finished. Any failure "hangs up" the tape control at a trap address and BUSY remains active.

## 

6250 WRITE SERVICE REQUIREMENTS
The write buffers fill automatically at the maximum rate permitted by the control unit, cable, and channel delays. This diagram shows when byte requirements occur. The channel must respond only to the average need during the period of overrun, checking such that at least one ECC (error correction code) group remain in control unit buffers at all times until stop occurs. Note that no individual channel byte transfer is overrun checked.
36 bytes are pre-buffered and one ECC group or more must remain in the buffer at all times prior to Stop. This time could permit some data chaining or be considered a safety factor.

Notes:
1] Proportionately more on lower speed tape units.
[2] The Resync Burst consists of a mark 1 group, 2 sync groups, and a mark 2 group. It is interleaved in a block of data after
every 158 data groups, and is used to re-synchronize the rea circuits during a 6250 read operation

3803-2/3420

| XG0800 Seq 1 of 2 | 2735978 | See EC History | $\begin{aligned} & \begin{array}{l} 845958 \\ 1 \text { Sep } 79 \end{array} \end{aligned}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 6250 READ SERVICE REQUIREMENTS

The channel buffer and both read byte buffers are empty at the start. Overrun is called only if there is
insufficient room in the buffer for a waiting ECC group. The ECC rate varies according to corrections required but follows the tape rate average over periods of 50 bytes or more. The channel has until the postamble end to accept all data from the buffer. Note that no individual data transfer is checked for overrun. To overrun, the buffer fills during a channel lag
There is excess read buffer capacity equivalent to 10 usec* available for "slip" or possible data chaining. The time may be distributed or lumped. Overrun check effectively starts at the 34th byte since that is the tota buffer capacity.

## C OPER-cLOck CIRcUITs

## MICROPROCESSOR CLOCKS CONTROL LOGIC

Hardware clocks control both microprocessors (MP1 and MP2). The clocks are stepped by $20.48-\mathrm{MHz}$ pulses.
The MP2 clock is similar to the MP1 clock shown.
The clocks run on either 150- or 200-nanosecond cycles. The length of the cycle depends on the instruction.
The numbers on the clock outputs (CLK1-CLK22) bear no relationship to the times these lines become active within the clock cycle.

## Clock Timing Chart

##  OPER-LSR BUFFERS

## LOCAL STORAGE REGISTERS

The Local Storage Registers (LSRs) serve as buffers to hold command codes, addresses, error conditions, and any other data the microprocessors use. Each
microprocessor has 32 Local Storage Registers. Each register holds one byte ( 8 bits) of data and a parity bit The registers are numbered LSR 0 through LSR 31 .
Data from the D Register is stored in the LSRs, and the output from the LSRs goes to the A Register and the B Bus.
Microprogram instructions gate the contents of the LSRs to other registers.

When the LSRs are used, Field 1 of the microprogram instruction addresses a specific register.
The procedure on page 12-012 displays contents of local storage registers

ROS/LSR Logic

## STAT REGISTERS

STAT registers are used for microprocessor to microprocessor communication and for microprocessor to data flow communication.

MP1 Stat Register Usage

| MP1 <br> Stat |  |
| :---: | :--- |
| 0 | Stop |
| 1 | Sense |
| 2 | Sense II |
| 3 | Diag. Mode |
| 4 | Stat A |
| 5 | Stat B |
| 6 | Stat C |
| 7 | Stat D |

MP2 Stat Register Usage

| MP2 <br> Stat |  |
| :---: | :--- |
| 0 | Tape Op |
| 1 | Start R/W |
| 2 | Wr ID |
| 3 | 7 Trk |
| 4 | Stat A |
| 5 | Stat B |
| 6 | Stat C |
| 7 | Stat D |

MP1/MP2 Stat Registers

## CROSSOVER (XOUTA/XOUTB)

## REGISTERS

The MP1 XOUTA Crossover Register is both a buffer for MP1 control information and a transfer register when sending a byte of information to MP2.

The individual bits from XOUTA (XOUTA BIT $x$ ) are used for the following
Bit Location Function
0 FC211 Gates unit serial number to Channel.
1 FC211 Gates EC level and features data to channel BW151 Gates 7-track Mode Sets Generates WRITE END GATE TO DF
2 BN311 Gates 7-track Mode Sets
3 BN311 Gates 7-rrack Mode Sets

- BW51 Gates Write Tape Mark
$\begin{array}{ll}\text { BN311 } & \text { Gates 7-track Mode Sets } \\ \text { CN031 } & \text { Gates NRZ1 Track-in-Error }\end{array}$
BW151 Gates WRITE MARK 1
5 CNO31 Gates NRZI Track-in-Error
BN231 Gates WRITE MARK 2
6 PR161 Gates the Sense Bytes to Channe BW151 Gates WRITE A2
7 PR161 Gates Sense Bytes to Channel CNO31 Gates NRZ1 Track-in-Error BW151 Gates WRITE A

The contents of XOUTA are gated to MP2 by XFR XINA TO LSR 2 on AA431. Output of XOUTA in MP1 is called XINA in MP2.
MP1 XOUTB crossover register is a transfer egister sending a byte of information to MP2 When MP1 XOUTB is used, MP2 traps to address 000. The contents of XOUTA becomes an index to a specific routine in MP2.
The MP2 XOUTA crossover register is both a buffer for MP2 control information and a transfer register when sending a byte of information to MP1

Bits from XOUTA (XOUTA BIT $x$ ) are used as follows:
Bit ALD
$0 \quad$ BW231
AA141 Gates PE Mode
AA141 Altes forward operation
CCO21 Gates Sync Mode for Detection
$\quad \begin{array}{ll}\text { BW231 } & \text { Gates } 6250 \text { Mode } \\ \text { CB111 }\end{array}$
AA141 Gates low gain to read log
The contents of XOUTA are gated to MP1 by XFR XINA TO LSR 1 on AB441. Output of XOUTA in MP2 is known as XINA in MP1.
The MP2 XOUTB Crossover Register is a transfer egister sending a byte of information to MP1. This register is primarily used to send sense byte from MP2 to MP1 for transfer to channel

## MICROPROCESSOR LISTINGS

Microprocessors 1 and 2 have different listings that can be identified by ALU1 or ALU2 printed in the upper left corner of each page
Listings are in four parts

1. General reference information, sense byte descriptions, Local Storage Register layout, branch condition codes, transfer codes, etc
2. Equate statements which specify a symbolic name for a value. Equate statements are generally followed by a description of the use of the constant.
3. Listing of the executable instructions.
4. Cross reference table containing all symbolic names used in the listing. This table includes the length of the referenced field, its value, the statement number in which it is defined, and the statement number of all instructions using the symbolic name.

## COMMUNICATION BETWEEN <br> MICROPROCESSORS

Either microprocessor can move a byte of information from an LSR to either the XOUTA or XOUTB registers. The other microprocessor can then move the byte of information from the XOUTA or XOUTB register to an LSR.
Each microprocessor can test, with Branch On Condition instructions, STAT BITS B, C, and D from the other microprocessor.

## LINKING MICROPROGRAM ROUTINES

LINK registers store microprogram addresses for return to a major routine from subroutines. Before branching to a subroutine, the address of a Branch Unconditional instruction is stored in a LINK register. The Branch Unconditional instruction must be in the same page as When the subroutine has completed its function, the contents of the LINK register are transferred to the Instruction Counter. The microprogram then branches oo the Branch Unconditional instruction, which, in turn, branches to the return point in the calling routine.

MP1 has six link registers named LINK 1 through LINK6 and MP2 has three LINK registers named LINK 1 through LINK3. The LINK registers are loca storage registers used for linkage purposes. The specific local storage registers used for linkage are

| LINK | MP1 | MP2 |
| :--- | :--- | :--- |
| LINK1 | LSR16 | LSR28 |
| LINK2 | LSR17 | LSR25 |
| LINK3 | LS18 | LSR26 |
| LINK4 | LSR19 |  |
| LINK5 | LSR24 |  |
| LINK6 | LSR25 |  |

Multiple link registers are available because there may be several possible branches out of a subroutine

## MICROPROCESSOR (MP1 AND MP2) FUNCTIONS

Two microprocessors (50-003) control logic operations of the tape control

Operation of MP2 is dependent on the operation of MP1. MP2 remains idie until MP1 supplies it with an address at which to begin. MP1 operates constantly, either executing a routine required by the operation being performed or polling the possible conditions that can require the execution of a routine.
Microprocessors consist of
Read Only Storage (ROS) in which the microprogram is stored for use by the microprocessor. The contents of ROS cannot be modified by the microprogram

An Arithmetic Logic Unit (ALU) which performs all arithmetic and logic operations: ADD, AND, OR, and XOR.
Registers and Buses to hold or transfer data for subsequent use.

Read Only Storage is addressed by three-dig hexidecimal numbers 000 through 7FF. Each addressable unit in the Read Only Storage is 16 bits long. The first digit of the address specifies a page (block of 256 addresses) of Read Only Storage. Each microprocessor has 8 pages of storage, 0 through 7 256 addresses in a page. 256 addresses in a page

In general, MP1 handles all logic operations dealing with the channel and MP2 handles the operations dealing with the tape units.

The microprocessors can transfer bytes of informatio between them and test single bits stored in the othe microprocessor

## MICROPROCESSOR INSTRUCTIONS

The microprocessors use 12 instructions. See following pages.

## MICROPROCESSOR INSTRUCTION

## FORMA

Microprocessor instructions have the following format [label]OPCODE field 1 ,field2[comments]
where label is a one- to eight-character name by which the instruction can be referenced. Branch instructions point to locations in the microprogram by label.
OPCODE is the operation to be performed on the data or addresses in Field 1 or Field 2.
Field 1 is generally the address of a Local Storage Register. In some instructions this field may be a ranch condition or ROS page number.

Field 2 is generally a constant, referred to as a decimal number or by a symbolic name. The value of symbolic constants for each microprocessor is listed in the beginning of the listings as EQU statements. In some instructions this field may be a branch address or transfer code
Field 2 can contain several symbolic constants combined arithmetically, that is, the sum or difference of two or more constants.
For example, the constant in the instruction:
ADD WORK 1,ONES-174
results in the constant hexidecimal FF (ONES) minus the decimal value 174 or a decimal value of 81

## MICROPROGRAM EC's

Microprogram EC's are applied with two Array Patch Cards, type DEO1, which provide auxiliary ROS arrays The arrays contain four sets of microcode patches ALU1 and 2 for 3803-1 and 2). Plug each card as shown in Figure 1 in order to select the proper patches for it's location. The following patches ar active when these two cards are installed (refer to page 52-102 for the patch listings):

1. Alternate Path Device Busy
2. Velocity Retry Extension
3. Turnaround Delay

Allocated Busy
5. Truncated Postamble
6. Extra Device End
7. Sense Reset

Verify factory plugging:

Note: If RPQ S10231 is installed see plugging instructions on pages 52-103/104.

## HIGH-ORDER ROS REGISTER

The High-Order ROS Register in each microprocessor holds the 8 high-order bits of a microprogram
instruction. The registers in MP1 and MP2 are identical Bits 0 though 3 contans Bits 4 through 7 and the $\mathrm{Hi} / \mathrm{Lo}$ latch can also contain the LSR address.
Bit 3 will be zero for OR, AND, ADD, XO, and STO instructions. In these instructions, bit $3=0$ allows the addressed LSR to be updated.
Bit 3 in this register serves different purposes,
depending on the instruction being executed. Bit 3 is part of the operation code for the modified instructions ORM, ADDM, ANDM, and XOM. This use prevents updating the LSR by blocking the gate to the LSR, CLK upda
15.

Bit 3 is part of the branch condition code for the BOC instruction. There are 32 branch condition codes used.

## LOW-ORDER ROS REGISTER

The Low-Order ROS register in each microprocesso holds the 8 low-order bits of a microprogram
instruction. The registers in MP1 and MP2 are identical The output from these registers goes to the A Bus, ransfer decode cir
depending on the instruction

## A REGISTER

The A Register serves as a buffer for information from an LSR that is used as input to the ALU. The contents of the selected LSR are gated to the A Register by XFR LSR TO A REGISTER. The next logic operation (ADD, with the contents of the instruction's Field 2 and places with the contents of the instruction's Field 2 and places
the result on the $A$ Bus.

During logic operations, the A Register is reset by the CLK 4 line.

## CHANNEL TAGS IN REGISTER

The Channel Tags in register holds the channel tags bits until they are transferred to the Channel Bus In. Individual register bits are used as follows:

Bit
Function
Chain Hold A
Chain Hold B
Hold Interface or Bus
Cu Busy
Service in
Status in
Status in
CTI Bit 5 to
C
Address In
CTI Bit 6 to CE
Op In

## CHANNEL BUS IN REGISTER

The Channel Bus In register serves as a buffer to
transfer bytes from LSRs in MP1 to channel.

## TAPE UNIT BUS OUT (TUBO) REGISTER

The TUBO register is a buffer to hold control
information. High speed output is ORed with data bus
bits.
The TUBO register stores MP2 control information for the 3420. The output information is multiplexed with tag lines (MOVE, CONTROL, COMMAND) to control tape unit functions

## 1 C

## OPER-MP REGISTERS

## D REGISTERS

The D Register serves as a buffer between the ALUs and LSRs.
A CLK 22 pulse loads the data into the D Register and resets individual positions when no data is available to load them.
Transfer (XFR) microinstructions gate input from BUS OUT
CLK 21 degates D Register input from the ALU during store and transfer operations. During logic operations, his input remains active because CLK 21 does not occur. ERRORS)

The Special Register in MP1 (AB461) is not used as a conventional register, because the input gate is always active and the latchback is always inactive. MP1 hardware errors merely pass through the register becoming SPEC REG BITS 0-7. When needed, parity bit is generated to maintain odd parity.
Special Register bits are activated as follows:

## Spec Reg Bit

${ }_{-1}^{\mathrm{Reg}}$ Bit Error Lin
0 ALU Parity Error ALU1 ROS Parity Error ALU1 C or XFR Parity Error ALU Microprogram Error ALU1
Instruction Care Error ALU Instruction Care Error Unused Branch Error Interface ALU1

## MP2 SPECIAL REGISTER (TU BUS IN)

The Special Register in MP2 (FD011) is used as the Tape Unit Bus In Register. The Device Bus In bits are called DEVICE BITS LATCHED. The register gate is CLK 8 SET TUBI ALU2. When needed, parity bit is
generated to maintain odd parity.

## MIST OR TCS REGISTER (MP1)

The MIST (Multi-Interface Tags) Register (FC181) is used as a Request In Register when the Two-Channel Switch (TCS) feature is installed. This register has four bits assigned as suppressable and non-suppressable REQUEST INS for Channel $A$ and $B$.
Bit functions are:
Bit Function
4 Suppressable REQUEST IN Channel A Non-suppressable REQUEST IN
Channel A
6 Suppressable REQUEST IN Channel B Non-suppressable REQUEST IN

## ADD/ADDM (HEX CODE A OR B)

1. The LSR byte selected by Field 1 (ROS reg bits
$4-7$ ) is placed on the B Bus.
2. The A register is ORed with the constant in Field 2 (ROS reg bits 8-15).
3. The result is placed on the $A$ bus.
4. The $\mathbf{A}$ bus and the B bus are added together
5. The result is placed on the $D$ bus.

If the operation is an ADD, the $D$ bus is stored into the LSR byte addressed by Field 1 and the $\mathrm{Hi} /$ Lo latch. The result of an ADDM operation is not stored in an LSR. The result of either operation remains on the $D$ bus until the next ALU operation. While on the D bus the result of the operation is available for branch control. The A Register is reset at the end of the operation.

## C OPER-LOGICAL AND

## AND/ANDM (HEX CODE C OR D)

1. The LSR byte selected by Field 1 is placed on the B bus.
2. The A Register is ORed with the constant in Field 2.
3. The result is placed on the $A$ bus.
4. The A bus and the B bus are ANDed
5. The result is placed on the $D$ bus.

If the operation is an AND, the D bus is stored back into the LSR byte addressed by Field 1 and the $\mathrm{HI} / \mathrm{LO}$ latch. The result of an ANDM is not stored in an LSR The result of either operation remains on the $D$ bus until the next ALU operation. While on the D bus, the result of the ANDM operation is available for branch control. The A Register is reset at the end of the operation.

${ }_{52} \mathrm{C}_{2}^{\mathrm{CO}}$

Sample of a Logical AND Instruction

## ORI/ORM (HEX CODE 8 OR 9)

1. The LSR byte selected by Field 1 is placed on the B bus.
2. The A register is ORed with the constant in Field 2.
3. The result is placed on the $A$ bus.
4. The A bus and the B bus are ORed.
5. The result is placed on the $D$ bus.

If the operation is an ORI, the D bus is stored back into the LSR byte addressed by Field 1 and the $\mathrm{Hi} /$ Lo latch. The result of an ORM is not stored in the LSR. The result of either operation remains on the D bus until the next ALU operation. While on the D bus, the result of the operation is available for branch control. The A Register is reset at the end of the operation.

3803-2/3420
$\left.\left.\begin{array}{|l|l|l|l|l|l|l|l|l|}\hline \text { XG1400 } \\ \text { Seq 2 of } 2\end{array} \begin{array}{l}2735984 \\ \text { Part Number }\end{array} \right\rvert\, \begin{array}{l}\text { See EC } \\ \text { History }\end{array} \begin{array}{c}845958 \\ 1 \text { Sep 79 }\end{array}\right]$

## XO/XOM (HEX CODE E OR F)

1. The LSR byte selected by Field 1 is placed on the B bus.
2. The A register is ORed with the constant in Field 2.
3. The result is placed on the $A$ bus.
4. The $A$ bus and the $B$ bus are exclusive ORed.
5. The result is placed on the $D$ bus

If the operation is an XO the D bus is stored in the LSR byte addressed by Field 1 and the $\mathrm{Hi} / \mathrm{Lo}$ latch. The result of an XOM operation is not stored in an LSR The result of either operation remains on the D bus th of ALU open is Wella for bran, A The A Register is reset at the end of the operation.

## $C C$ oper-branch unconditional logic

## BRANCH UNCONDITIONAL - BU (HEX

## CODE 6)

1. The contents of ROS reg Fields 1 and 2 are set into the Hi IC and Lo IC
2. The contents of the A reg are not altered.

Sample of a Branch Unconditional Instruction

bRANCH UNCONDITIONAL

## C C C C oper-store logic

## STORE - STO (HEX CODE 0 OR 1)

1. The contents of Field 2 are stored in an LSR selected by Field 1.
2. LSR selection is modified by the condition of the HI/LO latch and ROS register bit 3 (see logic diagram).

## 3. The A register is reset.

$\square$

|  | $\begin{array}{l}\text { See EC }\end{array}$ | $\begin{array}{l}\mathbf{8 4 5 9 5 8} \\ 1 \\ \text { Hep } 79\end{array}$ |
| :--- | :--- | :--- | :--- |

## TRANSFER - XFR (HEX CODE 4 OR 5)

The hex value (transfer decode) in Field 2 controls all transfer operations. All XFR decodes for both ROS1 and ROS2 are on 52-101.
Some transfer decodes cause data to be transferred between an LSR selected by Field 1 and a hardware register selected by Field 2. LSR selection is modified by the condition of the $\mathrm{HI} / \mathrm{LO}$ latch and ROS reg bit 3 (see logic diagram).
Some transfer decodes do not select LSRs (that is, Field 1 is ignored). These operations create miscellaneous Set, Reset, and Gating pulses to hardware.
One transfer decode (ROS1 XFR decode of 14) transfers data from one hardware register to another (ROS1 XOUTA TO DEAD TRK REG).
Contents of the A register are not altered except as described under special condition 1 below.

## Special Conditions:

1. Whenever a XFR from LSR to A reg (Field 2 hex 21) is decoded, the XFR is really a logical OR (for example, A register bits that were ON remain ON)

Sample Transfer Instruction

$$
\frac{\text { Set current adr on channel bus in }}{\text { Programmers comment }}
$$

Field 2 mnemonic of hardware register selected
Field 11 memonic of $L S R$ selected Mnemonic of transfer op code
Mnemonic of the location of the instruction (label)
Field 2 hex value which will select desired hardwar - Field 2 hex value which will select desired hardw
Field 1 hex value which will select desired LSR
Hex value of XFR op code
ROS address at which this XFR instruction is locted
2. Whenever a XFR 'HDWERR' (Field 2 ALU1 $=11$ or $\mathrm{ALU2}=44$ ) is decoded, the following actions occur:
a. Bit 4 in sense byte 11 or 12 (ALU1 or ALU2 respectively) is set.
b. The UPGM Control Check indicator* on the CE panel is turned on.
c. IC is reset to 000 (ROS1 starts executing at 000 -ROS2 holds at 000).

* For additional information on microprogram control check, see 75-003: "'CE Panel Indicators.

3803-2/3420

## 

## OSCILLATOR GATING

Crystal oscillators supply the basic timing pulses that drive the clocks and counters throughout the 3803. The Microsecond Frequency used at any specific tim depends on the speed of the tape unit addressed. The depends on the speed of the tape unit addressed
Detection Register gates the correct frequency.

The master clock controls the read clock stepping pulses.

##  OPER-LOGIC CIRCUITS (Cont'd) <br> WRITE CHECK REGISTER <br> <br> POINTER REGISTERS

 <br> <br> POINTER REGISTERS}

Objective:
This register is a temporary buffer for the channel buffer write byte from either interface bus out or read data track.

Objective:
An ORC byte character is generated for each ECC group.

Objective:
The POINTER register accumulates the pointers for one group of 6250 data. These pointers are used for correction as required.

## 

## CYCLIC REDUNDANCY CHECK (CRC)

 GENERATIONTwo cyclic redundancy check (CRC) errors set sense bits. A CRC error sets sense byte 3 , bit 3 and a CRC III error sets sense byte 9 , bit 3 . See $50-000,50-001$, and 50-002 for relationships to data flow.

## CRC GENERATION DURING 9-TRACK WRITE

 OPERATIONSWrite data from the channel is shifted into the CRC A register ( $50-000$ ), byte by byte, as the channel buffer is loaded. As the data is being read out of the channe buffer, the output is shifted into the CRC B register Accumulas demanded by the write section. Accumulated contents of CRC A and CRC B registers (53-066) Dropping or picking up a bit empties tranfering data through the chan buftr in mismatch and sets P COMPARE ERROR (byte 3 bit 7 ) mismatch a dit 9 and sense byte 9 , bit 2
a. 6250 bpi Mode

The content of the CRC A register is written on tape as the CRC III byte. The CRC III byte is also shifted into the Write CRC generator (50-001) with data and other bytes. Content of the WRITE CRC
b. PE Mode

CRC III is generated during PE operations for write checking, but is not written on tape.
c. 9-Track NRZI Mode

Only the accumulated data bytes generate the CRC byte.

## CRC USE DURING READ BACK CHECK OF

 WRITE OPERATIONSa. 6250 bpi Mode

Data previously written is read back through the normal read data path and the Check CRC Byte is sompared with CRC B ; a mismatch sets CRC III error and sense byte 9 , bit 3 During tead back check,
During the read back check, all data bytes and other bytes are shifted in the READ CRC register. The result should be a match pattern in the READ CRC register. Any other pattern sets CRC error only.
b. PE/9-Track NRZI Modes

Only data bytes are read back and stored in CRC C register ( $50-000$ ). Contents of CRC C register are compared with CRC B (53-066). A mismatch sets CRC III error and sense byte 9 , bit 3 .
c. 9-Track NRZI Mode

All data bytes are read back and combined with the CRC byte in the READ CRC register (53-065). The accumulated bits should result in a match pattern. Any other pattern sets CRC Error.

## CRC GENERATION DURING 9-TRACK READ FORWARD OPERATIONS

CRC generation during a read forward operation is similar to CRC generation during the read back check of a write operation. Data bytes read from tape go to the channel buffer ( $50-000$ ) and also into CRC A the channel buffer ( $50-000$ ) and also into CRC A register. CHANNEL BUFFER FULL initiates data transfer register. Accumulated contents of CRC A and CRC B registers are compared when the channel buffer empties ( $53-066$ ). Dropping or picking up a bit or bits in transferring data through the channel buffer results in a mismatch and sets P COMPARE ERROR (byte 3 bit 7) and sense byte 9, bit 2.

6250 bpi Mode:
CRC generation and use during 6250 read
operations is identical to CRC use during read back checking.

## CRC GENERATION DURING 9-TRACK READ BACKWARD OPERATIONS

CRC generation detects the loss or gain of bits transferred through the channel buffer during both read backward and read forward operations.

6250 bpi Mode
Read CRC error determinations are identical in 6250 read backward and read back checking operations except that bytes are shifted into registers in a reverse order.
The CRC C register accumulates combined data bytes and the check CRC bytes. With no read errors, the result should be a match pattern in the CRC C register Any other pattern sets CRC III error and sense byte 9 , bit 3.

7-Track NRZI operations do not use a CRC checking procedure.

## WRITE TRIGGERS

## WRITE TRIGGER OPERATION

Data bytes from the CHANNEL BUS OUT consist of binary ones and binary zeros. The tape control and tape unit convert these binary bits to flux changes ape. The 6250 bpi and NRZI methods of writing istinguish ones from zeros by a flux change for a one and no flux change for a zero.
hase encoding (PE) distinguishes ones from zeros by direction of flux change. A flux change in one direction indicates a one bit and in the opposite direction indicates a zero bit.
Write triggers produce magnetic flux changes on tape in one direction when they are flipped on and in the opposite direction when they are flipped off.

## 6250 BPI WRITE TRIGGER OPERATION

250 bpi method of writing on tape flips the WRITE TRIGGERS at Write Clock 7 to write one bits on tape. The Write Clock runs to Write Clock 11 and then starts over.

## PE WRITE TRIGGER OPERATION

In PE operation, the write clock runs from 0 through 15 for each cycle

Each byte is set into the write encoder. For each bit of the byte that is a one, the corresponding write trigge is "set up" at WC7. All write triggers are flipped at WC15 to write a byte on tape with flux reversals in one direction for one bits and in the opposite direction for zero bits.

## NRZI WRITE TRIGGER OPERATION

For a NRZI write operation, each byte is set into the write encoder. For each one-bit of the byte, the corresponding write trigger is flipped to write a flux reversal on tape. For zero-bits of each byte, the write trigger is not flipped, and thus, no flux reversal is written.

## RIC-ROC

The read section contains nine 32 -position Read In
Counters (RICs), one for each track, and one
32-position Read Out Counter (ROC).
A RIC specifies which skew buffer position receives the next one or zero bit for a data byte read from tape. When a bit is detected, it is placed in the skew buffer, and the RIC for that track is stepped to the next position.
The ROC selects the skew buffer position from which a byte is transferred to the group buffer.
Initially, all RICs and ROC are reset. As each bit of the first data byte enters skew buffer position 0 , the corresponding RIC is stepped from 0 to 1 . When none of the RICs are equal to ROC, RIC-ROC NO-COMPARE activated, indicating that all bits of the byte have entered the skew buffer. RIC-ROC NO-COMPARE gates outputs of the ROC counter to the ROC image register and steps the Read Ready Counter, which times the read out of the skew buffer.
The operation continues in this manner until GROUP BUFFER FULL or IBG becomes active to stop the read out.

## 803-2/3420

$\square$

RIC-ROC

[^0]53-081

## SKEW DETECTION

3803-2/3420

## GROUP BUFFER COUNTER

## Objectives

1. Limits skew buffer read out to one 6250 group of data ( 5 bytes per group).
2. Controls skew buffer read out in PE Mode after the first five bytes are read out to give one-byte-in and one-byte-out control.
3. Controls translator operation during a group buffer read out to convert five parallel 6250 bytes into four serial data bytes.
4. Controls translator operation to detect 6250 characters and to decode format marks.
5. Group buffer counter counts to five and conditions translator for read out to ECC group buffer. If ECC group buffer is full, counter stepping is inhibited.

3803-2/3420

READ CYCLE CONTROLS

Clock is initialized with 00-07 only when TAPE OP becomes active.
Format Groups and PE mode use " $A$ " cycles only

## initial selection of tape unit

## DESCRIPTION

The initial selection sequence is the communication between the channel and tape control that initiates an operation.
During initial selection, the tape control obtains initial status information that indicates the availability of the status information that indicates the availability of the
selected tape unit. If the tape unit response indicates it is available, the tape control activates lines that tell the tape unit to perform a specific command. In response to the command, the tape unit furnishes additional status information that indicates its ability to perform the specified command. If the tape unit is capable of performing the command, the tape control activates MOVE to the tape unit.
The communication between the tape control and tape unit is over the device interface lines.

## DEVICE INTERFACE LINES

The device interface is composed of the following lines that perform the listed functions:
BUS OUT ( 9 lines): Transmits commands, amplitude sensing levels, write data, and sense byte identification to the tape unit.
MOVE tag: Initiates tape motion
COMMAND tag: In conjunction with BUS OUT, initiates the execution of a command.
CONTROL tag: In conjunction with BUS OUT, initiates the execution of a control command.
CLOCK/METER OUT: Causes the tape unit usage meter to run.
BUS IN (9 lines): Transmits status, sense information, and read data to the tape control.
TACHOMETER IN/BUSY IN: When no tag is active,
this line indicates that the tape unit is busy. When any OUT tag is active, this line carries the capstan tachometer pulses to the tape control.

INTERRUPT: This line signals the tape control that one of the following unusual conditions has occurred in the tape unit.

- Load Check
- Loss of mechanical ready during a rewind
- Transition from not ready to ready status occurred
- Transition from ready to not ready status occurred while the MOVE tag was active
- BOT was sensed during a read backward operation

## C $\underset{\text { OPER-SELECTION AND PRIORITY }}{C}$ C

## TAPE CONTROL AND TAPE UNIT

 SELECTIONA tape control and tape unit are selected by placing the combined tape control and tape unit address on CHANNEL BUS OUT. The address on CHANNEL BUS OUT is compared with the address assigned to the tape control. (To assign a tape control address, see 90-110.)
If the address on CHANNEL BUS OUT matches the internally generated tape control address, ADDRESS internally generated tape control address, ADDRESS gated to the TU SELECT register.
The tape unit addresses are determined by the tailgate position to which the tape unit is cabled.

## TAPE CONTROL AND TAPE UNIT

 ADDRESSINGThe combined tape control and tape unit address is The combined tape control and tape unit address is 16 address feature, bits 0 through 4 are used for the tape control address, and bits 5 through 7 are used for the tape unit address. In subsystems with the 16 address feature, bits 0 through 3 are used for the tape control address, bits 4 through 7 are used for the tape unit address

## TAPE UNIT SELECTION PRIORITY

On subsystems with a Device Switching feature, more than one tape control may try to access the same tape unit at the same time. To handle this situation, the switching logic has card jumpers that establish priorities for each tape control in the subsystem. Tape controls with device switching features are shipped with device selection priorities already plugged. It should not be necessary to change these priorities. See Section 90.

## Tape Unit Selection

1 A four bit address on the B Bus is set in the TAPE UNIT ADDRESS SELECT register.
2. The inbound and outbound address decoders then decode ROS2's TUTAG BIT 4 and the Address Select lines.
33 One of eight select lines is active to the crosspoint switches to determine which tape unit will be used.
(D) On machines with the Two-Channel Switch feature installed, the TUADR BIT 2 SELECT B line and the BUSY/TACH line generate METERING IN to channel B. The NOT TUADR BIT 2 SELECT B line and the BUSY/TACH line generate METERING IN to channel A .
(E) This circuit interrogates a tape unit's status without selecting the tape unit.

## CHANNEL PRIORITY CIRCUITS

- 'Select out' priority determines the order in which tape controls are selected if more than one tape control requires service at the same time.
- A tape control's 'select out' priority is determined by jumpers in the tape control and by the tape control's location on the I/O interface.
- The select signal leaves channel on the SELECT OUT line and returns to channel on the SELECT IN line if it is not 'trapped by a tape control requiring service.
- A tape control not requiring service propagates the select signal to the next lower priority tape control.
- Jumpers in each tape control determine whether the tape control will respond to the SELECT OUT line ('select out priority high') or the SELECT IN line ('select out priority low').
- All units shipped from the factory are jumpered for high 'select out' priority. If it is necessary to change the priority, see 90-120
- Device Selection priority circuits are present in tape subsystems where a tape unit is accessed by more than one tape control. See 54-010. These circuits act as 'tie breakers' when two or more tape controls are trying to select a tape unit at the same time.
- Additional jumpers in the switching logic of each 'host' tape control establish device selection priorities (1, 2, 3, or 4) for each tape control in a tape switching configuration.

| XG3000 Seq 1 of 2 | 2736000 | See EC History | $\begin{aligned} & 845958 \\ & \hline 1 \text { Sep } 79 \end{aligned}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

3803-2/3420

## 1 COCC <br> OPER-LWR LOGIC

## LOOP WRITE TO READ (LWR)

Loop write to read allows checking tape control and tape unit data and control paths without moving tape The LWR (8B) command can be initiated from the processing unit or the CE panel. An LWR performed from the processing unit uses the same data path normal write operation. The following sense byte
errors cannot be detected
Data Checks:
Early Begin Read Back check Early Ending Read Back check Slow Begin Read Back check Slow End Read Back check Velocity During Write check
Equipment Checks:
No Block on Record Read Back check No Block Detected on WTM
Velocity check
Tach Start failure
A loop write to read operation is initiated from the CE panel by entering the command code (8B), and it receives its data from one of two locations. A count of service responses generates a ripple pattern, which is selected by putting the Command Control switch at the Ripple position. The fixed data comes from the Write Data switches when the Command Control switch is in the Write Data position. A CE panel LWR writes continuously until it is stopped by operating the Reset switch, except when the LWR with gaps jumper is installed (A1S2G08 to ground).

## LWR TAPE UNIT OPERATION

The tape control activates SET DIAGNOSTIC and the COMMAND tag. The DIAGNOSTIC MODE latch is set in the tape unit (FT104). READ/WRITE GATE (FT104) ANDs with DIAGNOSTIC MODE to activate LOOP SELECT (FT147). The tape control activates the MOVE tag and drops the COMMAND tag, then the diagnostic OOP SELECT octive mates BUS OUT data back to tap OOOP SELECT active gates BUS lin back to tap control via the tape unit response lines.

3803-2/3420

## COCOCOC

BASIC RECORDING TECHNIQUE

## DESCRIPTION

Three types of recording techniques are used in the IBM 3803-2/3420.

- Phase encoded (PE)
- Non-return to zero IBM (NRZI)
- 6250 bpi group coded recording (GCR)

Data bytes contain a combination of one and zero bits to represent binary ones and zeros. The PE tape system uses a flux change from minus to plus to system uses a flux change from minus to plus to
represent a one bit, and a flux change from plus to minus to represent a zero bit. (The NRZI system uses a flux change in either direction to represent a one bit and lack of a flux change to represent a zero bit.) Flux changes on tape are created by changing the direction of current through the write heads by the write triggers.

## PHASE ENCODED (PE)

## (See Figure 1)

- At write clock (WC) 15, flip all write triggers to write ones or zeros on tape.
- To write a PE one bit, the write register is reset. Set up write trigger by setting it at WC 7 if not already on from previous byte so that write trigger can be reset at WC 15 (complemented).
- To write a PE zero bit, reset the write trigger a WC 7 so that WC 15 turns it on.

## NRZI

## (See Figure 2)

Flip write trigger at WC 15 to write one bits only. Do not flip write trigger to indicate a zero bit.

## 6250 BPI

(See 55-008)

## MIODE SET 1(SEVEN-TRACK NRZI

 OPERATION)Mode set 1 commands sent to seven-track tape controls establish tape unit operating mode for succeeding seven-track NRZI operation. Bits 0 and 1 control density ( $556 / 800$ bpi); and bits 2,3 , and 4
control parity (odd or even), data converter (on or off) and translator (on or off) circuits in the 3803.
A mode set 1 command affects operation of all seven-track tape units attached to the 3803 . Unless reset, the 3803 retains its mode setting until it receives another mode set 1 command.
Mode set 1 commands sent to a 3803 without the seven-track features are treated as no-op commands, except that sense data bytes are reset (no-op reset initial selection 200 bri mode set 1 commands (hex codes $13,23,2 B$, and 33 ) default to 555 bpi.

## MODE SET 2 (NINE-TRACK PE/NRZI OPERATION)

Mode set 2 commands sent to PE/NRZI dual density tape controls set operating mode ( 1600 bpi PE or 800 bpi NRZI) for succeeding write or write tape mark 3803 without the dual density feature are treated as 3803 without the dual density feature are treated as reset (no-op reset sense). Channel end and device end are set during initial selection.

## diAgnostic mode set

A diagnostic mode set command causes an artifical signal loss condition that checks read and write error detection circuits.

- In PE mode, whenever write data contains successive one bits in any track, writing in that track is inhibited until the last one-bit is reached.
- In nine-track NRZI mode, no bits are written in track P.
- In seven-track NRZI mode, no bits are written in track C.
A diagnostic mode set command affects only write operations for the command in which it is issued Channel end and device end are set during initial selection.
Note: For additional information, see 53-070

## GROUP CODED RECORDING (6250 BPI)

Group coded recording (GCR) offers many advantages over previously used recording methods. This recording offers higher reliability even with existing tape libraries. Greatly expanded error correction rates and lower access times give higher throughput reduced channel time resulting in higher systemput, performance. Data is compacted on tape, reduci rewind times, shortening the length of tape required for rewa data, shacing the number of reels, reducing a daunts and dismounts, and improving overall tape handling.
The data is recorded in blocks, or groups of characters A block of data may be a single character or byte, or number of bytes as determined by the programming system used. The significant improvements in the GCR mode are

1. The information data is recorded at an effective density of 6250 bytes per inch (bpi) of tape.
2. The separation between blocks (IBG) is 0.3 inches $(7,6 \mathrm{~mm})$.
3. Simultaneous errors in any two of the nine tracks are corrected automatically.

## GCR BLOCK

A GCR block consists of a preamble, data, and a postamble (see 55-009). The preamble and postamble are each 80 bytes long and serve to synchronize the read detection circuits in a manner similar to previous 1600 bpi subsystems. The data portion of the block consists of the following

1. Data to be written by the 6250 bpi feature is continuously collected in seven character groups (9 bits in each character) and is held in the control unit 6250 bpi feature circuitry. (see 50-000 through 50-002 for second level logic details.) An error correction character is generated and then added o the seven characters to make an eight character data group. This data group is then divided into two each of the 9 tracks are encoded into five bits. (see Figure 1a through 1e.) This matrix of bits, $9 \times 10$, is recorded on the tape (see Figure 3a on 55-010).

Reading of the tape reverses the process, with error correction occuring where needed. There are as many of these 10 bit storage groups as there are multiples of seven channel data bytes in the record block.
2. The remainder, or last group of the channel data bytes (zero to six bytes) is encoded with whatever pad bytes are necessary, an auxilliary check pad bytes are necessary, an auxilliary check
character, and the error correction code (ECC generated from these into a 10 -byte residual group. This residual data group is created for every block recorded even though no residual bytes are found in the record. The auxiliary check character verifies read and write operations.
3. End of data (EOD) is signaled by a unique subgroup of five bytes immediately preceding the residual group.
4. Following the residual group, a 8 -byte cyclic redundancy check (CRC) is encoded into a ten bit group. This group, with the auxiliary check character, ensures the integrity of the read and write operation, including verifying any error corrections that may have taken place.
5. Interleaved into the recorded block, every 158 storage groups, is a resync burst. This burst allows the tape control to put into full operation any track(s) that have lost synchronization or were dead tracking for greater throughput.

## Figure 1a.

Figure 1b.

Note: There are 1106 bytes of channel input data in each 1580 ( 6250 bpi ) group recorded data block written on tape.

## COCCCCCl basic recording technioue (Cont'd)

## GROUP CODED RECORDING 6250 BPI

## GROUP CODED RECORDING 6250 BPI

(Cont'd)
6250 bpi does not relate to actual writing density on tape, but to effective data density. Actual density (9042 bpi) is greater due to the formatting and encoding. bpi) is greater due to the formatting and encoding.
This formatting and encoding is transparent to the user The formatting and encoding method allows reliable error correction for any two tracks simultaneously in error. Also, tracks are not immediately dequeued or dead tracks assigned when an error occurs as they were in the past. It is conceivable that a block could have errors in all nine tracks and appear to the user to be read error free as long as only two tracks have errors at any given instant.

## COMMON START I/O (SIO) ROUTINE

This section introduces the microprogram controls used to read and write a record from load point. Addresses noted within the charts are key checkpoint addresses which perform a major function.
These charts provide major syncronization points within a routine, and lay out a path to check the path through the microcode. The common Start 1/O routine is followed by the write operation, then the read operation from load point. The paths shown are for single, unchained operations with no exceptional conditions.
Using the compare ROS stop sync on ROS address of the CE panel (see sequence 10 on page 12-011), synchronization can be developed at various points within the operation being performed.

Remember that many routines are commonly used many times and will provide unstable synchronization points.
Some knowledge of basic microprogram concepts is assumed. XOUTA and XOUTB registers as well as the status registers A, B, C, and D provide response back and forth between the ALUs. ALU1 basically controls the processing unit channel, while ALU2 controls the device interface. Both ALUs control various portions of the data flow.
ALU2 is a slave to ALU1, and is controlled by a transfer command and XOUTB branch index byte being passed from ALU1 to ALU2. Response from ALU2 is by way of ALU2 status registers.

## 1 C C C C C 1

BRANCH TO WRITE FROM LOAD POINT

Write from load point is performed by controlling drive motion and controls with ALU2. ALU2 also sets the data flow control to write the single 1 or P track identification (ID) at load point.
ALU1 initiates the first data Service-In cycle, then relinquishes data transfer to the hardware. ALU1 also controls the write triggers for all control characters within the preamble, postamble, and resync burst

Once the data portion of the write command is entered ALU2 monitors velocity during the tach period transitions to test for velocity change during write.
The write operation is divided into the following steps

1. Trigger ALU2 to issue a sense reset to the drive ALU1 will monitor ALU2 Status D, which indicates that ALU2 is finished with sense reset
2. Fetch TU sense bytes 0 and 1 and test for drive status
3. Raise Service In for one byte of data before turning control of the channel over to the data flow section.
4. ALU1 again allows ALU2 to perform the write operation.
5. Set Erase in the drive (not Write Status yet) and erase backward, then forward. (Backward 150 tachs, forward 140 tachs.)
6. Test for Tach Start fail or Velocity Error, then write 1-track ID burst.
7. Write self-adjusting gain control (SAGC) burst with the inverse Tape Mark (no zone 1) attached to the end.
8. Set SAGC circuits in the drive to perform read back check.
9. Write record preamble consisting of the following characters: 10101, 01111, seventy 1s, 00111
10. The hardware data flow section now takes over the writing of data while ALU2 monitors the capstan tach velocity in the drive
11. Every 1106 channel bytes ( 158 storage groups on tape), ALU1 intersperses a resync burst consisting of: 00111, 11111, 11111, 11100
12. When data is complete, the hardware writes an all ones character.
13. ALU1 checks for an all ones character indicating the end of data. This allows for writing of the residual and CRC frames.
14. ALU1 then writes the postamble consisting of the following characters: 11100, seventy $1 \mathrm{~s}, 11110$, 10101
15. ALU2 waits for IBG, then tests for errors. ALU2 finishes by setting Status D and trapping to 000 .

BRANCH TO READ FROM LOAD POINT

Read from load point is basically performed by ALU2 and the hardware data flow controls.
Once ALU1 has triggered ALU2 to perform sense rese to the drive, and again to initiate the read from load oint, ALU1 is basically finished. ALU1 tests to be sure oop until ALU2 finishes and sets Status D.

The read forward operation from load point steps follow:

1. ALU1 triggers ALU2 to issue a sense reset to the drive.
2. ALU1 triggers ALU2 to begin the read operation. If Status D from ALU2 is sensed before the first service cycle, an error is signalled.
3. ALU2 tests the status of the drive and checks for correct velocity.
4. Move 3 in . $(76,2 \mathrm{~mm})$ of tape, then test for a 1 -track envelope indicating a 6250 bpi tape
5. Count through part of SAGC, then initiate read SAGC circuits in the drive.
6. Clock through 550 tachs, then check the Inverse Tape Mark.
7. When IBG is reached, fetch two bytes of drive sense and test status to this point.
8. Set read condition after gap control comes up again, and wait for the Mark 1 character preceding the data.
9. The hardware data flow now takes over until the end of data is sensed
10. Test for errors. ALU2 sets Status D when finished altering ALU1.
11. ALU1 compares the modulo count then branches to the status handler.

## WRITE TRANSLATOR (CARD A1E2)

## TRANSLATOR

Some tape subsystems use a six-bit BCD code. Each character of the six-bit code can be translated to an equivalent eight-bit character for processing by 9-track tape subsystems. A translator in the tape control and translates six-bit code to eight-bit code while
dinglas six-bit code to eight-bit code while XOUTA bits 2 and 4 are on at the rise of TAPE OP and Microprocessor 2 Stat bits 0 and 3 are

On 7-track write operations with the translator off, the tape control discards the two high-order bit positions (BUS OUT bits 0 and 1) of each byte from channel. Only the six low order data bits (plus a parity bit) are ransferred to the tape unit.
On 7-track read operations with the translator off, the ape control inserts zeros in the two high order bit positions (BUS $\mathbb{N}$ bits 0 and 1 ) of each byte when transferring it to channel.

## ECBDIC AND BCD CODES

ebcolc - 8 Bit Code

$\uparrow_{\text {Note }} 2$

BCD - 6 Bit Code

Notes
[1] The graphics in these charts may not be identical to those printed by the printer or printer-keyboar The graphics are intended as references for translating bit codes on a read or write operation
[2] The write translator accepts the complete EBCDIC code and translates the bits to the BCD code. However, the read translator translates the BCD code only to the bits outlined.
[3] When operating in the even-parity mode, the EBCDIC blank (bl) is translated to a BCD substitute blank (bl), and the BCD substitute blank is translated to an EBCDIC blank ( 01000000 ). The odd parity blank's bit code is 000000 .

## READ TRANSLATOR (CARD A1E1)

Read Translator Data Flow
ANDs and ORs translate bits 0-7 to determine EBCDIC
code.

## WRITE DATA CONVERTER (CARD A1E2)

The data converter is used for 7-track write and read forward operations only.
The data converter is disabled during read backward operations, but is left on for the next write or read forward operation.
The data converter is turned on and off by a mode set command. When Microprocessor 1 XOUTA BIT 2 is on command. When Microprocessor 1 XOUTA BIT 2 is at the rise of TAPE OP (MP2, Status 0), the data converter is off. When Microprocessor 1 XOUTA BIT 2
is off at the rise of TAPE OP (MP2 Status 0 ) the data is off at the rise of TAPE OP (MP2, Status 0), the data converter is on.
During a write operation, three 8-bit EBCDIC bytes from channel are converted to four 6-bit BCD characters for writing on tape. If the byte count is not a multiple of three, any remaining bits of the last 6-bit character are set to zero.

## DATA CONVERT WRITE TIMING

## 3803-2/3420

## C C C C C

OPER-LOGIC CIRCUITS (Cont'd)
READ DATA CONVERTER
During a read operation, four 6 -bit characters (plus
parity) from tape are converted to three 8 -bit bytes
(plus parity) for transfer to channel. If the character
count of the block is not a multiple of four, any
remaining positions in the last byte having bits are
padded with zeros, and a data convert check is
indicated.

3803-2/3420

##  OPER-S/360-S/370 SWITCHING (DATA IN HANDLING)

## OBJECTIVES

1. The switching circuit enables a 3803-2 to be attached to either a System/360 or a System/370.
2. Selection is accomplished by plugging cards to reflect system type on which the tape subsystem is installed. See installation, Page $90-130$ or AA010 Sheet 2.
3. When plugged for $\mathrm{S} / 360$, a Service $\mathrm{In} /$ Service Out sequence is used.
4. When plugged for $S / 370$, a Service $\ln /$ Servic Out/Data In/Data Out sequence is used.

A 3803-2 tape control with a two-channel switch (TCS) 1] operates with two channel interfaces. All 3803-2 operations can be performed on either channe interface. Channels attached to the TCS interfaces can interface. Channels attached to the TCS interfac systems, allowing tape units on the tape control with the TCS feature to be shared by two channels on a single system, or by two systems. In addition to all normal operations, a tape control with this feature can execute Reserve and Release commands for program control of interface switching. The large block in the center of the diagram and the unshaded blocks represent control circuits for a standard tape control. The shaded blocks represent additional logical functions installed on the tape control for the Two-Channel switch.

Two Systems Sharing a Tape Control
Through the Use of a Two Channel
Switch

Channel interface lines going into or out of the tape control pass through interface switch circuits. The crcuits consist of gated drivers that connect the tape (Aonnect the tape

Tie-breaker logic (XM101) controls the interface switch lines so only one channel operates the subsystem, preventing one channel from interfering with the operation of the other. When neither interface is reserved or operating, the in in a neutral state, and either interface can initiate an Initial Selection sequence

Address decoders monitor the bus out lines of each interface. If the tape control address appears on the bus out lines along with an ADDRESS OUT on the decoders send a signal to the interface switch controls. When no interfering conditions exist the controls connect that interface to the tape control. If the tap control is reserved or operating with the other interface, a 'short busy' sequence is sent to the interface attempting to break in.
When the tape control becomes available, a Control Unit End status byte is sent to the channel that previously received the BUSY signal.

## OPER-TWO-CHANNEL SWITCH (TCS) (Cont'd)

The Sense/Reserve command (F4) locks the wo-channel switching circuits to one interface, so the other interface does not have access to the tape ontrol. The Sense/Release command (D4) resets the reserved condition and allows commands from e

When a tape unit completes an operation, a Device End ignal is sent to the channel. A tape control with the Two-Channel switch uses the second Device End LSR to ensure that the Device End is returned to the channel that initiated the operation. See Device End on 58-012.

## RESETS

The Reset circuits of the two-channel switch are interlocked so a Reset from one channel cannot disrupt operations on the other channel. A Reset can be accepted only from the operating channel. Resets are urther conditioned to prevent a channel from destroying information needed by the other channel.

## INTERFACE SWITCH CONTROL

A tape control with a Two-Channel switch monitors addresses on two channel interfaces. When the tape control receives its own address, it tries to start an operation with the interface attempting selection. If the tape control is neither busy nor reserved, the
OPERATIONAL IN latch for that interface is activated. If the tape control is busy or reserved to interface A, interface B ADDRESS OUT will be answered with a Hhic BUS SHORT BUSY will rece. The CU END when the tape control is available If the channel stack tatus containing UNIT CHECK or UNIT EXCEPTION, the tape control will remain connected to that interface until status is accepted. If both interfaces attempt election simultaneously, a tie-breaker circuit resolves the selection. See 58-030.
The purpose of interface switching circuits is to connect he tape control 'common' circuits to whichever interface is operating. To operate with an interface output from the OPERATIONAL IN latch (FC141) gates OPERATIONAL IN is gated by -SWITCHED TO CHANNEL A (or B) ( $58-030$ ).

The two-channel switch microprogram is entered by branching from Initial Selection (or Ending Sequence) to ensure that data is sent to or from the proper interface.

## RESERVE/RELEASE OPERATION

- A Sense/Reserve command locks the tape control to an interface until a Sense/Release command or a Reset is received from that interface.
- A Sense/Release command resets the RESERVE flag to allow operation on either interface.
A Sense/Reserve or Sense/Release command, while chained, results in Command Reject.
After Initial Selection, operation of Sense/Reserve and Sense/Release commands are identical to a Sense command.
The Sense/Reserve and Sense/Release commands enable the tape control to remain locked to one interface. Executing a Sense/Reserve command places a tape control under exclusive control of one channel until that channel issues a Sense/Release command. A Sense/Reserve command from channel A or B activate e RESERVE flag for A or B. A Sense/Release command deactivates the RESERVE flag
Modifier bits, in positions $0,1,2$, and 3 of a Sense command byte identify the reserve and release perations. After Initial Selection, modifier bit 2 determines whether the command is a Reserve or a Release. If bit 2 is on, (command code F4) Reserve is indicated. If bit 2 is off, (command code D4) Release is indicated.

## SENSE/RESERVE COMMAND [F4]

A Sense/Reserve command locks the tape control to the interface of whichever channel initiated the command.
During Command Out of a Sense/Reserve command the current command is masked for the F4 configuration. If an (F4) command is recognized, the microprogram checks for chaining (SETRESV). LAGS1 ( SR 10) to red CURFLAG (20) is set haining is indicated Command Reject is set.

In a valid Sense/Reserve command, bit 2 from the CHANNEL TAGS IN (CTI) register (FC161) prevents resetting the SWITCHED TO CHANNEL A or SWITCHED TO CHANNEL B latch (58-030) and the tape control remains reserved to the operating interface. Output of the SWITCHED TO A (or B) latch blocks interface switch circuits for the opposite interface

58-030) until a reset or Sense/Release command is received from the operating interface.

## SENSE/RELEASE COMMAND [D4]

A Sense/Release command resets the RESERVE flag to allow the tape control to operate with either interface. As in the sense/reserve operation, the Sense/Release command checks for chaining. A valid Sense/Release command leaves position 2 of the CHANNEL TAGS IN register reset so the SWITCHED TO CHANNEL A and SWITCHED TO CHANNEL B latches are reset at the end of each chain of commands

## SELECTION

Address decoders in the tape control continuously monitor both interfaces. If the correct address bits arrive on the bus out lines along with an ADDRESS OUT tag, the SELECT OUT latch is reset. CONTROL UNIT END latch OFF ANDs with a minus output from the SELECT OUT latch to generate TRAP CHANNEL A or TRAP CHANNEL B.
Assume that the tape control is idle and is addressed by channel A. The TRAP CHANNEL A line ANDs with by channel A. TigNAL CHAN A to set the SWITCHED TO CHANNEL A (tie breaker) latch. SWITCHED TO CHANNEL A ANDs with DELAY SELECT SIGNAL CHAN A to generate INITIAL SELECTION CHAN A
Once interface $A$ is addressed and selected, it arms the ONTROL UNIT BUSY AND circuit in interface B. If terface B tries to use the tape conch, du CONTROL UNIT END latch for interface $B$ is set.

When interface $A$ is finished operating, MP1 determines hat the Two-Channel switch is installed, and MP2 hecks status of the CONTROL UNIT END latches. either CUE latch is on, MP1 presents CUE status to the interface associated with that latch. The CUE will have a random tape unit address unless presented along with Device End.

## PARTITIONING

Partitioning, achieved by operating the Enable/Disable switches, restricts the accessability of the tape control to either channel. Partitioning bypasses SELECT OUT and degates all interface functions. When both
interfaces are partitioned (both switches set to DISABLE), the tape control is offline and the CE pane controls can be used.

## IMPLICIT CONNECTION

An implicit connection is one that does not depend o program intervention for release. The duration of the connection is determined by the time required for the ape control to perform a command or a chain of ommans. The switch reverts to neutal on completion (at the tape control level) of the last command in a chain

An implicit connection is extended if the channel stacks primary status. The stacked status must then be accepted by the channel to terminate the connection. If the status byte contains Unit Check, a contingent connection is made and acceptance of the status by the channel does not terminate the connection
If the channel stacks secondary status containing Unit Exception or Unit Check, connection to that channel will be maintained until the status is accepted by the hannel. If the status byte contains Unit Check, a contingent connection is made and acceptance of status by the channel does not terminate the connection.
If the channel stacks secondary status other than Unit Check or Unit Exception, the switch returns to neutral and is available to either channel. Any further attempts by the tape control to present this status to the channel that indicated STACK STATUS are controlled by SUPPRESS OUT from that channel.

## CONTINGENT CONNECTION

A contirgent connection is initiated when the last status byte contains Unit Check. The connection is maintained until a command other than Test I/O or NOP is received from the channel to which status was to that tape unit clears the contingent connection if the tape unit is READY.
The purpose of the contingent connection is to ensure an available path to the tape unit and the transmission of sense data from the tape unit to the proper chann If a Test I/O or NOP is issued by the addressed channel to a tape unit other than the one contingently BUSY and retains the connection.

## BUSY

While the tape control is operating with one interface, a SELECT from the other interface will be answered with a SHORT BUSY signal (Bits P, 1, 3). Assume tha the $B$ interface is operating when the $A$ interface attempts to address the tape control (58-030). The SWITCHED TO CHANNEL B latch blocks the setting of the SWITCHED TO CHANNEL $A$ latch. However, - SELECT SIGNAL CHANNEL A is ANDed with -ADDR COMPARE CHAN A and NOT PROPAGATE SEL OUT CHAN A to reset the CHANNEL A SEL OUT latch. With the latch reset, the minus output of the off side of the latch is ANDed with -ENABLE CHAN A and OPERATIONAL IN to condition one input to the channel A CUE latch. A second conditioning input is OPERATIONAL IN, and the third is the minus outpu from the CU BUSY AND circuit. Thus, the CUE latch for channel $A$, is turned on to send CU BUSY STATUS CHAN $A$ to the $A$ interface
The BUSY signal sent to channel A is a Unit Status byte with bits 1 and 3 on. Bit 3 indicates BUSY, while bit 1 (status modifier) indicates that the BUSY condition applies to the tape control. Bits P, 1, and 3 are forced onto the BUS IN lines at the same time the STATUS IN tag line is forced up. The STATUS $\mathbb{N}$ latch is not turned on during this SHORT BUSY sequence.

## CONTROL UNIT END

The CONTROL UNIT END latch (58-030) remains on, remembering that channel B tried to break into channel A operations. This latch also sends +CUE PENDING CHAN $B$ to the microprogram branch-on-condition logic (AB161) to notify the B interface that a Channel End is pending. When the tape control is no longer operating with, or reserved by, interface A, the SW TO CHAN A latch turns off, -TRAP CHAN B is active, and the SELECT CHAN B line is still active to turn on the SW TO CHAN B latch.
The SW TO CHAN B latch gates the output from OPERATIONAL IN to channel B to send a Unit Status byte to channel $B$. The status byte will contain a CUE other operations the tape control is NOW avalaber used to transmit the CUE status byte.

At the end of an operation, the SW TO CHAN A (or B latch is reset unless a chain, STACK, INTERRUPT, or UNIT CHECK condition exists. OPERATIONAL IN is reset in the Burst Ending Sequence when CHANNEL TAGS IN register bit 7 is reset.
With OP IN reset, no REQUEST IN, no ADDRESS OUT, and no SELECT OUT for the tape control, the SELECT OUT latch is active. (Note that the SELECT OUT latch is turned on when the tape control is inactive.) With the SELECT OUT latch active, the plus output degates -RESPONDING TO CHAN A (or B). -RESPONDING TO CHAN A (or B) inactive resets the SW TO CHAN A (or B) latch, and the tape control is available for another selection sequence.

## STACK

In some cases the channel may refuse the end status byte, this turns on a 'stack' condition. If the status byte contains Unit Check or Unit Exception, the tape control remains connected to that interface until the channel accepts the status. If the status byte contains Unit Check, the connection is maintained until a command other than NOP or Test I/O is received from the channel to which the status was presented. This procedure makes certain the channel has an opportunity to interrogate a unit check condition before the other channel disturbs the tape control. When the interface connection is maintained because of a unit check, the connection is defined as "contingent" (not part of the normal routine).

Stacking of status other than Unit Check or Unit Exception does not maintain the interface connection. The TCS will be reset to neutral, and the tape control will become available to either channel.

## STACK INTERRUPT

A Halt 1/O command received by the tape control before the channel accepts the ending status causes two-channel operation and contingent check for contingent connection is needed to prevent loss of error information the microprogram branches to a 'Hold Interface' routine
With no contingent connection, an interrupt cycle is initiated to present the stacked status. CONTROL UNI BUSY will be reset (if applicable) and HOLD NTERFACE will be set if the STACK or STATUS PENDING flag is on

## DEVICE END

The purpose of Device End circuits is to signal the dat channel when a tape unit has completed a task and is ready to accept a new one. On a tape control with the two-channel switch feature, separate LSRs in MP2 are used to store the Device End signal for each channel. The second Device End LSR ensures that the Device End is returned to the channel that initiated the operation.
A Device End received while the two-channel switch is in a neutral state causes the tape control to enter an interrupt status. The tape control then presents the Device End to the channel that initiated the Device End operation, if that interface has not been partitioned Partitioning resets pending Device Ends for that interface.
An interrupt due to a Control Unit End sends Device End, including the address of that device, and Control Unit End, to the channel.

## TIE BREAKER

Tie-breaker logic (XM101) on 58-010) controls the interface switch lines so only one channel operates the subsystem, preventing one channel from interfering with the operation of the other. When neither interface is reserved or operating, the interface switch circuits are in a neutral state, and Initial Selection sequence

Address decoders monitor the bus out lines of each interface. If the tape control address appears on the bus out lines along with an ADDRESS OUT tag, the decoders send a signal to the interface switch controls When no interfering conditions exist, the controls connect that interface to the tape control. If the tape control is reserved or operating with the other interface, a 'short busy' sequence is sent to the interface attempting to break in.

When the tape control becomes available, a Contro Unit End status byte is sent to the channel that previously received the BUSY signal.
See 58-030 for schematic details.

##  OPER-TIE BREAKER (TCS)

 (PART 2)

## 

## OPER-DEVICE SWITCHING CONFIGURATIONS

## DESCRIPTION

Device switching allows access to a maximum of sixteen tape units by two, three, or four tape controls, and permits simultaneous operation of as many tape units as there are tape controls.

3803 Models 1 and 2 can be mixed in a switching configuration; however, attempting to access a 3420 Model 4, 6, or 8 through a 3803 Model 1 produces unpredictable results.
Device switching is performed via the Communicator and Device Switch features. Three Device Switch features (58-051) available with the tape subsystem are:

2 Control Switch used with $2 \times 8$ and $2 \times 16$ configurations

3 Control Switch used with $3 \times 8$ and $3 \times 16$ configurations
4 Control Switch used with $4 \times 8$ and $4 \times 16$ configurations
The minimum switching subsystem configuration allows two tape controls to access up to 8 tape units and is called a $2 \times 8$ configuration. The maximum configuration is 4 tape controls and 16 tape units ( $4 \times 16$ ). A on-switching configuration $(\times 8)$ is referred to as Selection Logic.

Device Switching logic is installed only in those tape ontrols that have attached tape units.
The location of the Device Switches depends on the configuration desired. For example: In a $2 \times 8,3 \times 8$, or $4 \times 8$ configuration, the switching feature is required only on the first tape control while in the $2 \times 16,3 \times 16$, and $4 \times 16$ configurations, the switching feature is required on Tape Controls 1 and 2 (58-051). The $2 \times 16$
configuration consists of two tape controls, each with a Communicator 1, a 2 Control Switch, and eight tape units. The tape controls may be connected to either different channels of the same system or on different systems
Device switching logic is logically invisible (except for BUSY responses during Initial Selection and Device End interrupts, which result when tape units become interrupts, which result when tape units become flexibility for a variety of system configurations. Subsystem priority and device addressing are assigned by pluggable jumpers within the switch. Any tape unit may be partitioned (made unavailable) to any tape control via toggle switches on the tape control operator's panel (58-060).

## 2 Control Switch

The 2 Control Switch is a $2 \times 8$ configuration of hardware switching logic (58-051, 58-055). Tape Units 0-7 (attached to Tape Control 1) can be accessed by the Communicator in Tape Control 2 as well as the Communicator of Tape Control 1. A $2 \times 16$ configuration is obtained by installing a 2 Control Switch in both Tape Controls 1 and 2, allowing the Communicator in each tape control to access its own eight 3420 s, as well as 3420 s of the other tape control.

## 3 Control Switch

A $3 \times 8$ configuration is obtained by installing a 3 Control Switch in Tape Control 1 only and a Communicator 1 in Tape Controls 1, 2, and 3 ( $58-051$ ). Tape units attach to Tape Control 1.
A $3 \times 16$ configuration is obtained by installing a 3 Control Switch in both Tape Controls 1 and 2. A third tape control must be added to the configuration. Tape Control 3 does not contain any switching hardware or attach any tape units, but does contain a Communicator.

## 4 Control Switch

A $4 \times 8$ configuration is obtained by installing a 4 Control Switch in Tape Control 1 and a Communicator 1 in Tape Controls 2, 3, and 4 (58-051). Tape units attach to Tape Control 1.
A $4 \times 16$ configuration is obtained by installing a 4 Control Switch in both Tape Controls 1 and 2. Two more tape controls must be added to the configuration Tape Controls 3 and 4 do not contain any switching hardware or attach any tape units, but each contains communicator
The 3 Control Switch and the 4 Control Switch are expansions of the 2 Control Switch. They allow acces to eight attached tape units by the additional Communicators.
$1 \times 8$ Configuration

## Notes:

[1] Maximum of 16 tape units and 4 tape controls
[2] Tape units attach only to tape controls with switching features.
[3] Any or all control units may have two channel switch features.
[4] For 3420 Model 8 power requirements, see 90-180.

## Switch section A on tape control 1 directs tape control 1 's access path to tape units 0.7 . Switch section $B$ on tape control 1 directs tape control 2 's access to tape units $0-7$.

Tape control 2 switches are similar to
tape control 1 , except section A direc tape control 1, except section $A$ directs
tape control 2 , sacesss to tape units $8-F$
Section $B$. Section 8 controls the access of tape
control 1 to tape units $8-F$
control 1 to tape units 8-F

## OPERATION

The Device Switch is controlled by lines from the tape ontrol. Although there are necessary switching delays, data transfers, control requests, and responses, tape unit status is sent to the tape control as if the switch were not present.
Selection: When DEVICE SELECT (58-090) is activated, with the device address on the DEVICE SWITCH bus and the node is enabled, the switch tries to set the COMMITTED latch for the node. Note: A "node" is the logic circuitry required to select and assign one tape unit to a requesting tape control. If the device has already been selected by another tape control, a BUSY indication is returned to the tape control attempting selection. If the device is not busy, the COMMITTED latch is set. The latch output is then sent to the other tape control nodes for that device to prevent selection by them. At the same time the committed latch is set he SELECT Crosspoint line to that node will become active and GATE BUS OUT will be the response to the selecting tape control. The BUS OUT and BUS IN connection has now been established between the tape control and tape unit. SWITCH SELECT is not required to select a tape unit, although it is always active in 803 subsystems.

Committed: Once the COMMITTED latch is set for a given node, it remains set until reset by the selecting tape control. Reset is accomplished by addressing and sending a 50 ns pulse on the SET/RESET line.
Priority: When two or more tape controls attempt to select a tape unit at the same time, priority of access is determined by jumpers plugged on Tape Controls 1 and 2 (58-100). See Section 90 for plugging details.

## LINE DEFINITIONS (58-100)

Busy/Tach: The BUSY/TACH line indicates the state of the device (busy or not busy) to the tape control. Device Operating Interface A and B (2 lines): A device perating line is active when a committed tape unit it BUSY/TACH line active Thatch has been set) has號 the tape control is used for METERING $N$ line for its chat DEVICE OP INTF B line serves the位 by the seond but is wo-Channel Switch feature is installed

Run Meter: When the node is enabled, the RUN METER line is sent to the device for meter operation. Set/Reset: The SET/RESET line is tied active so the ENABLE/DISABLE latch can be set to the corresponding state of the Enable/Disable switch on he operator's panel.

## 

## Notes:

[1] The maximum switch configuration consists of 16 tape units and 4 tape controls.
[2] Tape units attach only to the tape controls with device switching features.
[3] Any or all tape controls may have a Two-Channel Switch feature.

## Functional Units of the Device Switch are:

(A) Logic Section: The logic section communicates with the tape control to provide status, device address, and accessing interlocks. The information exchanged establishes tape unit attachment to tape control and presents switch status to the operating tape control or controls in the subsystem configuration.
(e) Crosspoint Section: The crosspoint section is a switch matrix capable of switching twelve inbound and twelve outbound lines. Each node (tape control/tape unit path) is controlled by the logic section.
(c) Communicator: The communicator replaces the selection logic circuits and associated device interface cabling in the basic tape control with interface cabling in the basic tape contro device switches. The communicator divides the device interface into primary and secondary and controls the gating of each according to the address of the device being selected. The communicator consists of interface drivers and receivers.
The Communicator 1 feature has only one external (primary) interface. The Communicator 2 feature has two external interfaces (primary and secondary). The secondary interface connects attached tape units primary interface connects a 3803 that does not have tape units attached to another tape control through Switch Section B.
(D) Tape Unit Online/Offline Switches: Tape unit toggle switches (58-060, 58-100) are located on the operator's panel of each tape control having a device switch feature. These switches enable the operator to detron in a $4 \times 16$ ape control in the configuration. In a $4 \times 16$ tape units so there are 64 toggle switches, 32 each on Tape Controls 1 and 2. There are no switches in Tape Controls 3 and 4.
Note: ©, ©, ©, ©, ©, ©, © refer to charts located in ALD XC-700 pages.

## C C C C C C OPER-DEVICE SWITCH NODE

Gating a control unit to device path node on or off effects switching at the device interface level
Each node consists of parts of three logic cards. The crosspoint cards (B) contain the electronic switches needed to switch the bus in or bus out lines for a node. The switc lient re cons. the tape controls.
1 The crosspoint (XPT) switches are gated by the set to the COMMITTED latch
2 COMMITTED lines prevent simultaneous selection of the same device by more than one tape control.
3 INTERFACE COMMITTED, COMMITTED, and DEVICE BUSY are ANDed to generate DEVICE OPERATIONAL, which is sent to the tape control to
develop METER IN for the channel interface.

4 DEVICE END INTERRUPT lines are scanned by the tape control to determine which tape unit has a DEVICE END INTERRUPT pending.
5 BUSY/TACH is available to the tape control when the node is selected and enabled and the DEVICE BUSY or SWITCH BUSY line is inactive.

## REF-CE PANEL

3803 CE PANEL DESCRIPTION

CE PANEL SWITCHES

PANEL ENABLE (TWO-POSITION TOGGLE) (b)

Active only if ROS is in normal mode. It may be necessary to raise the Set ROS Mode momentary switch to establish this mode. The Panol Enabied light is ON when the switch is ON

Note: If the Panel Enabled light does not light, set the ROS Mode rotary switch to Norm and operate the Set ROS Mode switch (momentary).

On
Allows the CE panel functions identified by yellow lettering to be performed with the Interface Disabled light either on or off

Allows all CE panel functions to be performed with the Interface Disabled light On.

Off
Degates the following functions:

1. Stop On-Control Check
2. Stop On-Data Flow Check
3. Reset/Start or Step
4. ROS Mode
5. Command Control switches (3)

STOP ON-CONTROL CHECK (TWO-POSITION TOGGLE)

Active only while ROS is in Stop mode.
On
Stops both ALUs when any control check is recognized in the ALU selected by the ALU1/ALU2 switch. The exact stopping location depends on the type of error: is usually two less than the stop address except for a BOC. Generally, microprogram-detected errors will not be recognized until a transfer hardware error (XFR HDWERR) microinstruction is executed. Most other errors will stop the ALUs when the failure occurs.
Disables the compare register equal features of the ROS Mode switch Stop position.

Off
Allows normal tape control operation

RESET/START OR STEP (TWO-POSITION MOMENTARY TOGGLE)
(2)

Active only while the Panel Enabled light is On

## Reset (UP)

Sets both ALUs to Instruction Counter (IC) address 000 and causes a Power-on Reset Branch Condition.

## Start or Step (Down)

Starts both ALUs after a stop condition, with
subsequent running of the ALUs controlled by the ROS Mode switch. Also resets the Compare Equal light at any time without interlocks.

## STOP ON-DATA FLOW CHECK

 (TWO-POSITION TOGGLE)Active only while Interface Disabled light is On (CE Mode).

On
Stops both ALUs at the completion of a command in which a failure occurs on Unit Check condition

Off
Normal tape control operation.
Note: When in CE Mode, the tape control stops on Unit Exception, regardless of switch position. To inhibit Unit Exception, regardless of switch position. To inhib Mode, jumper AA1T2J12 to ground.

LAMP TEST (TWO-POSITION TOGGLE)
(D)

Allows you to test the CE panel indicator lights. ROS MODE (SEVEN-POSITION ROTARY)

Active only while the Panel Enabled light is On. After selecting any of the seven positions of the ROS Mod switch, activate the Set ROS Mode momentary toggle switch to set the mode.

## Rst/Cmpr

When the IC address of the selected ALU equals the data in the compare register, both ALUs are reset to Display Select switch must be in IC position.)

Rst/Err
When a control check occurs, both ALUs are reset to location 000 and allowed to continue running

Set IC
Allows the contents of the compare register to set IC of the ALU selected by the ALU1/ALU2 switch.

## Norm

Normal running condition of both ALUs

## Stop

When the data in the compare register equals the IC address of the ALU selected by the ALU1/ALU2 switch, and the Display Select switch is in IC position both ALUs are stopped. The instructions at the stopped addresses will not have been executed.
When the Stop On-Control Check switch is active, both ALUs are stopped only when an error occurs in the ALU selected by the ALU1/ALU2 switch.
Note: If compare equal stop function does not work make sure the Control Check Stop switch is off.

## Step

Operating the Start or Step momentary switch allows stepping the ALU selected by the ALU1/ALU2 switch while the ALU not selected runs normally.

## Cycle

Allows the repetitive execution of an instruction at a selected address. Step or stop at the instruction address on which you want to cycle. Set ROS Mode to Cycle and press Start or Stop.

## ALU1/ALU2 (TWO-POSITION TOGGLE)

Selects the ALU to be controlled by the ROS Mod switch.

Selects the ALU when the Display Select switch is se to the ic, Bus In, Bus Out, Hi ROS, or Low ROS position.

SET ROS MODE/SET CE COMPR (TWO-POSITION MOMENTARY TOGGLE)

## Set ROS Mode

Sets the selected ROS mode.

## Set CE/Compr

Sets the data, selected by the three hex rotary switches into the register selected by the Data Entry Select switch. The Set CE/Compr switch operates without the panel enabled or the interface disabled.

## COMMAND CONTROLS

## (b) (b)

Active only while the Intf's Disabled light is on.

## Ripple/Wr Data

Establishes the data pattern mode for offline write commands

## Mple/Single

MPLE allows continuous cycling of the four commands entered with the Data Entry Select switch.
SINGLE allows single stepping of the four commands with each activation of the momentary Start switch.

## Stop/Start

STOP halts the continuous cycling of the four commands when the Mple/Single switch is in the MPLE position.

START initiates the commands stored in the CE command registers

DISPLAY SELECT (SEVEN-POSITION ROTARY)

CE Reg

1. Displays command/device in conjunction with Data Entry Select
2. Displays Write Data/Go Down or Byte Ct/Multiplie in conjunction with Data Entry Select.
Note: Some stop-on-error conditions stop the CE clock, which prevents displaying the contents of the CE registers.

## Cmpr Reg

Displays data currently in the compare register in indicators 0 through 11.

IC
Displays the IC address of the selected ALU in indicators 0 through 11.

## Bus In

With ALU1 selected, displays Channel Bus In data in indicators 0 through 7 and In Tags in indicators 8 through 11
With ALU2 selected, displays TU Bus In data in indicators 0 through 7 and the device address in indicators 8 through 11.

## Bus Out

With ALU1 selected, displays Channel Bus Out data in 0 through 7, and outbound control or tags in 8 through 11. Parity is only assured when the microprogram activates CHANNEL BUS OUT
With ALU2 selected, displays TU Bus Out data in 0 through 7 and outbound controls or tags in 8 through 11.

## Hi ROS

With ALU1 selected, displays ROS1 data bits 0-7 P1 in 0 through 7 and control lines in 9 through 11.

With ALU2 selected, displays ROS2 data bits 0-7 P1 in 0 through 7 only

## Low ROS

With ALU1 selected, displays ROS1 data bits 8-15 P2 in 0 through 7 and control lines in 9 through 11. With ALU2 selected, displays ROS2 data bits 8-15 P2 in 0 through 7 only.

## DATA ENTRY SELECT (SEVEN-POSITION

 ROTARY)

## Cmpr Reg

Allows data in the three Data Entry switches to be entered in the compare register

## mnd 1, 2, 3, and 4

With the Data Entry Select switch in one of the four positions (Cmnd 1, 2, 3, or 4), a command and its associated device address ( $0-F$ ) may be entered into one of the four command positions.

## Byte Cnt

The three Data Entry switch positions determine the total byte count. The left and center switches count to a maximum of 256. The right, or Multiplier switch counts in multiples of 1024. Position zero of the Multiplier switch adds zero to the total of the other two witches. Position 1 would add 1024, 2 would add 2048, etc. To provide a byte count of 3140 , set the left and center switches each to 4 , and set the right switch to 3 .
Note: Check to ensure you get the correct byte count

| Byte Count <br> Dialed | Byte Count <br> Written |
| :--- | :--- |
| 00 to FE | Byte Count dialed + |

FF 2

## Write Data Go Down

Write Data and Go Down determine those bits to be written and establishes the go-down time. The left and enter data entry switches determine the bits to be written. For example, the Ripple/Wr Data switch in Wr Data, 8 in the left switch, and 3 in the center switch writes the following:
$\begin{array}{llllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\ 1 & 0 & 0 & 0 & 0 & 0 & 1 & 1\end{array}$
Note: The P bit is automatically generated when required

The right switch determines the go-down time. Position zero gives a go-down of 6.0 milliseconds. The otal range is from 6.0 milliseconds to approximately 0.5 second. Each position, 0 to $F$, represents approximately 26 milliseconds. A setting of 3 results in go-down time of 6 milliseconds $+(3 \times 26)$, or pproximately 84 milliseconds.

- To write continuously, jumper from AA1R2J12 to ground.
- To do an LWR with go-down time, jumper from AA1S2G08 to ground.

## Data Entry

The three rotary switches are used to enter data into various registers. Set a command into the left switch and the TU address into the right switch. For example 01A entered into the Command register indicates a write command to device $A$.

## CE PANEL INDICATORS

## INTF'S DISABLED <br> nitis

ndicates when the tape control is offine. The manual Enable/Disable switch(es) on the CU operator's panel must be in Disabled position before the lamp comes on.

## CMPR EQUAL <br> $\overbrace{0}^{\text {comat }}$

Indicates that the data entered in the CE/Compare register equals that contained in any register selected for comparison.

CONTROL CHECK INDICATORS

## BOC

Checks the 16 branch conditions not checked by the HI IC PARITY/HI ROS register circuits. (A total of 32 BOCs are checked.) If an even number of BOC groups are active, a BOC error is indicated.

## B-Bus Parity

Checks the output of an LSR for odd parity on the B Bus on instructions which transfer data from ALU to an Bus on instructions which transfer data from ALU to an the hardware error latches and CE panel indicator.

Note: When displaying the LSRs, B-Bus parity errors can occur because LSRs are not set to odd parity with power-on reset.

## Hi IC Pty/Hi ROS Reg Pt

The circuits that set this indicator are

1. Hi IC parity check
2. Hi ROS register parity check
3. Instruction Decode error. (ROS instruction check to be sure only one ROS operation was decoded.)
4. BOC Error. (Check of 16 branch conditions.)

## Lo IC Pty/Low ROS Reg Pty

Checks parity of the IC (low order) and ROS register (low order). An even parity error sets the HARDWARE ERROR latch and CE panel indicator. Lo IC Parity is checked only on a BU or a successful BOC. Low ROS Parity is checked on every instruction cycle.

## D Bus Pty

Checks the parity of information to be stored in an LSR at 100 ns time. Bits 0-8 from the D Bus are
exclusive-ORed with the P bit from Bus Out. Even parity sets the D BUS PARITY ERROR latch and HARDWARE ERROR 5 latch, and lights the CE panel indicator. This error condition is only checked on a transfer of data into the ALU from an external source.

## U Pgm

Monitors the selected ALU and signals an error when the ALU detects any hardware error, including checkout errors for both ALUs.

## Data Flow Check Indicators

| Stop ON MTE Env Skew Read Wr Tgr upgm |  |
| :---: | :---: |
|  |  |
| () | (b) $\bigcirc \bigcirc \bigcirc \bigcirc \bigcirc$ |
| P Comp | ew Read CRC Wr Tgr uPgm VRC |

## P Comp

The P Comp indicator (also C Compare) is set by the following conditions

1. When parity of the byte sent to the channel buffer on read operations is wrong.
2. Buffer Overrun.
3. Write Address error
4. If CHANNEL BUFFER READ IN counter gets out of step.
5. Write buffers are empty when a write tape cycle occurs.
6. Parity does not match between the channel buffer and the write buffer outputs on write operations.
7. When operating in 7-track data convert mode and a count of bits before and after conversion does not match.
8. When operating in 7-track mode with the Data Converter off and the count of bits for each byte as it enters and leaves the register fails to compare.

## MTE/LRC

1. Set during a 6250 bpi write operation when there are two or more error pointers:
2. Set during a PE operation when there are two or more error pointers
3. Set during a NRZI operation when a block has an odd number of bits in any track (LRC).

## ENV/ECC

1. Set when any track signal falls below threshold on read or write. Does not set Data Check.
2. Set during a PE operation when any error pointer is set or when any track falls below threshold. Sets Data Check on write only
3. Set during a NRZI write operation if NRZI Register 2 has incorrect parity.

## Skew

Set when vertical misalignment of bits exceeds acceptable limits. (If all bits in a byte are not received by the read circuits within a specified period, the bit has excessive "skew" and Skew Error is set.

Skew Error is set.

1. During a 6250 bpi/PE read operation if RIC leads ROC by 30 bits.
2. During a 6250 bpi write operation if RIC leads ROC by 14 bits.
3. During a PE write operation if RIC leads ROC by 4 bits.
4. During a NRZI write operation by skew gate

## Read VRC

1. 6250 bpi Mod
a. Set during single-track error correction if a match is not found:
b. Set during a write operation if hardware pointer and correction code indicate different tracks.
2. Set during a PE operation if a parity error occurs and no track pointers are on.

## CRC

Set during 6250 bpi and 9 -track NRZI operations when the CRC byte calculated for a read operation does not match the CRC byte written on tape.

## Wr Tgr

Set when the output of the write triggers has incorrect parity.

## U Pgm

Set when ALU2 detects any microprogram error, including End Data Check on PE operations, and any error indicated in sense byte 8, bits $0-6$; sense byte 9 bit 1 ; and sense byte 10 , bits $0-7$

## NOTES ON CE PANEL OPERATION

- A Start I/O command to a tape unit that has Unit Check or Busy in its initial status byte will prevent stepping to the next command. This condition can be caused by a Not Ready tape unit

CE command sequence hang up: when an error occurs on a 3803 with the Two-Channel Switch (TCS) feature installed, a contingent connection is established without Stop On Error ON. This is caused by dedicated sense data from the failing tape unit. There are three ways to proceed:

1. Issue a Sense command to the same tape unit after any other type of command.
2. Issue all four internal program commands, except a Test I/O or NOP, to the same tape unit A Mode Set command can also cause a hang condition, so it may be necessary to replace this command following initial setup.
3. In order to allow command cycling to multiple tape units without changing the command setup, set ROS Mode to Rst/Cmpr using IC address 302 on ALU1. This restarts both microcodes at 000 on contingent-connection conditions and performs a general reset. To eliminate the need
 Ret FCO41) to AA1T2G05 (Sart Key Lal PK035).

## MASTER TAPES

Master skew tapes and master signal-level tapes are manufactured to rigid specifications. They are the standards that are used by CEs to obtain optimum tape nit performance
Because tape unit performance is directly affected by the accuracy of these master tapes, the following precautions should be taken:

1. Use master tapes only for their intended purpose . Handle tapes with care
2. Make only full-reel passes in order to have even wear throughout the length of the tape
3. Identify master tapes as such and mark the reels with the letter " $m$, as a reminder to make full passes only.

## MASTER SKEW TAPES

Master skew tapes have a density of 800 FCl and are written with one solid bit across the width of the tape These tapes are written on a specially adapted tape unit at the Tape Test Center with accuracy held to within 0.375 usec total skew between the leading and agging bits of a 112 ips tape unit.
The master skew tape will run off the reel when eading forward because it is written with no interblock (IBGs). In order to create an IBG and save time during skew adjustments, make the following alterations to the master skew tape:

1. Read the master skew tape forward to the end of tape EOT reflective marker
2. Install a write enable ring
3. Write one record of any size beyond the EOT marker
4. Remove the write enable ring.
5. Rewind the tape.

After the preceding one-time preparatory steps, set the tape control CE panel as follows when you use the skew tape

1. Command 1-Read Forward ('02')
2. Command 2-Read Backward ('OC')
3. Command 3-Read Forward ('O2')
4. Command 4-Read Backward ('OC')

The master skew tape will read forward to the end of he reel, read backward, and repeat the cycle. This permits checking skew from the rear of the tape unit without manipulating the controls.

## MASTER SIGNAL-LEVEL TAPES

Master signal-level tapes have the ability to produce a signal to within $\pm 2 \%$ of the primary master. (A primary master, which is established as an IBM standard, is the base for instrument alignment.)
All new master signal-level tapes are checked at 3200 FCl and 800 FCl . The suffix letter " $A$ " is added to the art number to allow field identification of
$3200 / 800 / 556 \mathrm{FCl}$ tapes as opposed to the forme $300 / 556$ FCI tapes. Thus, for example, a master ignal-level tape checked out at both 3200 FCl and 800 ign would have P/N 432152A.

## DEGAUSSER

Caution: The degausser will demagnitize any material such as tape, disks, etc. Power off the tape unit.

To degauss the read/write head:

1. Remove magnetic tape from the tape unit. Do not place the tape on top of the tape unit.
2. Plug degausser into 110 Vac receptacle.
3. Press the pushbutton on the degausser while it is at least 1 foot $(30,5 \mathrm{~cm})$ away from the read
head and move it slowly toward the head.
4. Hold the degausser against the front surface of the head for about 10 seconds.
5. Pull the degausser straight away from the head very slowly to a distance of at least 1 foot ( 30,5 cm ) and release the pushbutton.

## WATER MANOMETER

Note: The use of a 30 inch ( $76,20 \mathrm{~cm}$ ) manometer or the 80 inch $(203,20 \mathrm{~cm})$ pressure/vacuum gauge is not dependent on the English (metric) system of measurement.
Use the requested tool by part number and name, and measure to the specified units (whether metric or English) to obtain the desired adjustment or reading Shown are several setups for using the water manometer, part number 453500. Part A shows a single manometer measuring a pressure of less than 30 inches ( $76,20 \mathrm{~cm}$ ). Part B shows two manometers in series measuring a pressure between 30 and 60 inches $(76,20 \mathrm{~cm}$ and $152,90 \mathrm{~cm})$. Part C shows using the pressure divider and a single manometer measuring a pressure greater than 30 inches ( $76,20 \mathrm{~cm}$ )

General instructions for using the manometer are

1. Remove the tee from the tee and hose assembly, and connect the hose on the line to be checked.
2. Set up the water manometer by opening both top valves one full turn from closed position. (Incorrect readings will occur if valves are opened too far.)

Connect the pressure-sensing hose to one port leaving the other port open.
3. Fill the water manometer with tap water maintaining the water level near the 0 position on the scale. Zero the manometer by sliding the scal up or down until the 0 mark lines up within 0.2 inch $(5,7 \mathrm{~mm})$ of the bottom of the meniscus in both columns.
4. Set conditions for the specific item to be checked according to the pneumatic-adjustment decal located on the transfer valve and manifold.
5. Read the vacuum level. (The vacuum level is the sum of the displacement of the water level in each column.)

## PROCEDURES

Note: Take readings at bottom of meniscus.
1 Using a single manometer to measure a pressure of less than 30 inches $(76,20 \mathrm{~cm})$. Read at bottom of each meniscus and add the two readings解 $=3.7$.

12 Using two manometers in series to measure a pressure between 30 and 60 inches (76,30 and $152,40 \mathrm{~cm}$ ). Read at bottom of each meniscus and add the four readings together to get total pressure the sum of $X+Y) . X+Y=2.0+1.7+2.0+$ $1.7=7.4$ inches.
3 Using a pressure divider with a single manometer to measure a pressure of greater than 30 inches (76,30). First, measure a known pressure of less than 30 inches. Second, insert the divider and adjust the divider's adjusting screw until the manometer reading is $40 \%$ of its original reading Third, measure the pressure of greater than 30 nches by reading at he bottom of each meniscus multiplying $Z$ by 2.5 to $+17)=25(3.7)=9.25$ inches The maximum + 1.7) $2.5($ ing with this combina is 75 in $190,50 \mathrm{~cm}$ )

4 Using a pressure/vacuum gauge to measure a pressure greater than 80 inches ( $203,20 \mathrm{~cm}$ ).
a. Measure a known pressure less than 80 inches ( $203,20 \mathrm{~cm}$ ).
b. Insert the pressure divider between the measurement part and the gauge and adjust the divider's adjusting screw until the gauge reads $40 \%$ of its original reading
c. Measure the pressure greater than 80 inches $(203,20 \mathrm{~cm})$ and record the reading $(Z)$.
d. Multiply $Z$ by 2.5 to get the total pressure

Example: If $Z$ reading is $33.2,33.2 \times 2.5=83.0$ inches

## PRESSURE/VACUUM GAUGE

Shown below is pressure/vacuum gauge, part 5495384 To use the gauge

1. Attach the gauge hose to the fitting to be tested
2. Read the dial directly in pressure or vacuum. (For measurements above 80 inches ( $203,20 \mathrm{~cm}$ ) , add 1 inch $(2,54 \mathrm{~cm})$ to the reading for each $1 / 16$ inch $(1,59$ mm ) of pointer travel beyond the end of the scale.)
Caution: Disconnect from test point before loading or unloading tape unit to prevent damage or miscalibration of gauge.

## C C C C C C C C C C C C C C C C C C C C C

## tOOLS AND TEST EQUIPMENT (Cont'd)

## 3420 FIELD TESTER

Caution: Use extreme care when attaching the field tester because an error can damage the tape unit, the tester, or both. Be sure to use only the 3420 field tester, part 1765342, when doing offline maintenance on 3420 tape units. Do not use the 2420 Field Tester. When testing Models 4, 6, and 8, a field tester at EC level 734316 must be used. A temporary jumper must be installed from K2P02 to M2D06 for 6250 operation.
When operated with the field tester, the tape unit loads and unloads tape, reads, writes, and moves tape forward or backward.

To test several tape units simultaneously, use the manual controls on the tape control CE panel.

To use the field tester:

1. Unload the tape unit.
2. Switch the unit off line at the logic gate. To ensure that the on-off line switch circuitry is operating correctly, monitor the - interface disable and +int
dis or - off lines. Refer to page FT910 of the 3420 dis or - off lines. Refer to page F 910 of the 3420 operation of the on-off line switch circuits.

| Position of On-Offline SW | A1L6D04 | A1L6B03 |
| :---: | :---: | :---: |
| Online | +6 v | -4 v |
| Offline | Gnd | Gnd |

3. With the arrow on the cable pointing up, plug the tester into the wiring side of the logic gate at location A1N5. Another way to be sure the cable is plugged correctly is to make sure the notches on the cable connector are toward the center of the logic gate. Select, on the tape unit operator's panel, comes on when the Read/Write switch is in the MOVE switches to lad heady the tape unit switches to load and Ready the tape unit.

Caution: The field tester can cause tape dump and damage under the following conditions

1. When moving tape with field tester, the direction switch position is changed before activating "Stop".
2. When attached to a tape unit and set to "Fwd" and either " $\mathrm{St} / \mathrm{Stop}^{\prime}$ or "Go", the tape unit is loaded and goes to Load Point and becomes Ready. If RESET on the tape unit console is activated and the tape unit does not dump tape and then Reset is followed by activating
UNLOAD, the tape will run off the end of the reel
3. When using "Alt Dir", RESET is activated on the tape unit.
Conditions 1,2 , and 3 above can be eliminated by always putting the tester in "Stop" before doing any other operation.
The switches on the tester operate the tape unit by remote control as follows:

## Start/Reset

Operates the same as the control on the tape unit operator's panel. Start makes the unit ready. Reset resets the unit.

## Ld Rew/Rew Unld

Ld Rew loads tape if none is loaded, and rewinds tape to load point if tape was loaded but is not at load point. Rew Unld rewinds tape from any position, unloads the unit, closes the cartridge if one is used, and lowers the power window.

## Up/Fwd

Up/Fwd controls either the time the MOVE line is active during a start/stop operation, or the duration of forward motion in an alternate-direction operation.

## Dn/Bkwd

Dn/Bkwd controls either the time the MOVE line is inactive during a start/stop operation, or the duration of backward motion in an alternate-direction operation.

## St/Stp/Go/Stop

St/Stp causes interruptions in tape motion. Use the Up/Fwd control and Slow/Fast switch to adjust go-up
time. Use the Dn/Bkwd control and Slow/Fast switch to adjust go-down time. Go ensures continuous tape movement. Use the Alt Dir/Fwd/Bkwd switch to control direction. Stp halts tape motion.

## Alt Dir/Fwd/Bkwd

St/Stp/Go/Stop switch must be at Go to enable this switch. Alt Dir is active in read status only; it moves tape alternately forward and backward. Use Up/Fwd control and Slow/Fast switch to adjust duration of orward movement. Use Dn/Bkwd control and movement. Fwd causes forward tape motion. Bkwd causes backward tape motion

## Slow/Fast

This is a range switch for the Up/Fwd and Dn/Bkwd controls. Slow extends the go-up/down timing range o approximately 3.0 seconds. Fast decreases the go-up/down timing range to approximately 7.0 ms .

## Write/Read

Write causes the tape unit to write with gaps. Each time the tape unit writes, as in a start/stop operation, it generates a PE gap of 0.528 inch ( $13,4 \mathrm{~mm}$ ) and a GCR gap of 0.275 inch ( $7,0 \mathrm{~mm}$ ). Read causes continuous reading.

## 8/16/32 (Models 3, 5, 7) See Note

This switch controls the frequency of the tester's write oscillator. The three positions result in write frequencies of 800 fci (NRZI), and 1600 and 3200 fci (PE), respectively.

## 16/32/64 (Model 4, 6, 8) See Note

When a field tester at EC level 734316 is used on 3420 Models 4, 6, and 8 with the provided jumper installed, these switch positions represent 1600, 3200 , and 6400 fi as the label shows. Frequencies generated by the these tester frequencies with normal online recording ensities. densities.

Note: The back panel wiring on cable position A1N5 on Models 4, 6, and 8 is such that the frequency of the tester is doubled.

 SUBSYSTEM PREVENTIVE MAINTENANCEgeneral cleaning instructions
This procedure makes all previous 3420 tape unit cleaning procedures obsolete.
Items used by this procedure are contained in the IBM Tape Cleaning Kit, part number 352465 (see Figure 1).

Use IBM tape transport cleaner, part 8493001.
Performance results cannot be guaranteed when other chemical formulations are used. Other chemical formulations have not been tested by IBM, and their use may impair performance or cause damage to the tape unit or tape.

## DANGER

When using tape cleaner, do not get it on skin or clothing. Follow the instructions on the container. Do not use metal instruments to clean any part of the tape unit

Figure 1. IBM Tape Cleaning Kit

## TAPE UNIT CLEANING PROCEDURE FOR

 3420 MODELS 3 THROUGH 81. R/W AND ERASE HEADS
1.1 Unload tape and remove from tape unit
1.2 Open outer $\boldsymbol{A}$ and inner ( doors.

1.7 Use inspection mirror for Models 3,5, and 7 or dental mirror for Models 4, 6, and 8, to carefully inspect heads. (Clean mirror with dry cloth, if dirty.) If heads do not look clean, perform step 1.8 , otherwise wipe heads with dry clean cloth and go to step 2.
To remove stubborn residue from heads-
1.8 Use either style head cleaning brush dampened with tape cleaner to remove residue © and then return to step 1.3

1.3 Dampen clean area of lint-free cloth with tape cleaner
1.4 When cleaning Models 3,5, and 7, hold the inspection mirror down, use dampened cloth to clean the R/W and erase heads (C) using a circular motion
1.5 When cleaning Models 4, 6, and 8, hold autocleaner in and clean the R/W and erase heads C with a dampened cloth using a circular motion o reach the inside tracks, wrap the dampened cloth around a cotton swab.
1.6 Repeat steps 1.3 and 1.4 or 1.5 until cloth remains clean.

3803-1,2,3/3420

TAPE UNIT CLEANING PROCEDURE FOR
3420 MODELS 3 THROUGH 8
2. CLEANER BLADE, BOT/EOT BLOCK, REWIND PLUNGER, AND THREADING CHANNEL REFLECTOR
2.1 Hold the inspection mirror down, or the autocleaner in, when cleaning. Use a cotton swab dampened with tape cleaner to clean the following items.
2.1.1 BOT/EOT block ©

2.2 Use the head cleaning brush ( $\mathrm{P} / \mathrm{N}$ 6851781) dampened with tape cleaner to clean the cleaner block $\Theta$. Wipe with cloth

2.1.2 Rewind plunger/filler block ©
2.1.3 Threading channel reflector (c)

3803-1,2,3/3420

| $\begin{aligned} & \text { XHOBOO } \\ & \text { Seq } 10 \text { 2 } \end{aligned}$ | 2738018 | See EC History | 845958 1 Soe 79 | 847298 15 15 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

TAPE UNIT CLEANING PROCEDURE FOR 3240 MODELS 3 THROUGH 8
3. TAPE TRANSPORT
3.1 Install capstan cover (C)

3.2 Dampen cotton swab with tape cleaner and clean the following:
3.2.1 Front and back guides (0).

### 3.2.2 D-bearing (1)

3803-1,2,3/3420

| XH0600 | $2736018$ | See EC | $845958$ | $847298$ |
| :---: | :---: | :---: | :---: | :---: |

3.3 Use a lint-free cloth dampened with tape cleaner to clean the following:
3.3.1 Threading plates $(\mathbb{\omega}$.
3.3.2 Back of inner door ©

### 3.3.3 Back wall $\boldsymbol{P}$ and sides $\boldsymbol{0}$ of vacuum columns

3.3.4 Air bearings ( ©. Note: If residue remains in vacuum column corners, perform steps 3.3.5 and 3.3.6, otherwise go to step 3.4.
To remove stubborn residue in corners of vacuum columns-
3.3.5 Put clean felt pad on handle making sure the handle does not go through the end of pad.
3.3.6 Dampen felt pad with tape cleaner and clean vacuum column corners as shown (5. Make sure no contact is made with capstan cover and/or capstan.
Caution: You may need to use water to remove Caution. You may need to use water to remove residue left in the vacuum columns by some tapes. Water will damage the capstan.
3.3.7 Use a lint-free cloth dampened with tape cleaner to remove any residue left by the felt pad.
3.4 Check bottom of vacuum columns (1) for bits of tape and remove if present.
3.5 Remove capstan cover and replace in storage area.

## TAPE UNIT CLEANING PROCEDURE FOR

 3420 MODELS 3 THROUGH 84. CAPSTAN CLEANING-NORMAL PROCEDURE

This procedure must be done at regular intervals by the customer. Tape will slip on a dirty capstan while accelerating.
Caution: Any capstans not kept free of glaze will eventually build a deposit that cannot be removed by a reasonable amount of scrubbing
4.1 Wrap a clean, dry cloth around one index finger and a lint-free cloth dampened with tape cleaner around the other index finger.
4.2 Vigorously wipe the capstan rubber with the dampened cloth (without bending the capstan) while rotating the capstan with the
Collotcovered finger (U)
4.3 Continue this procedure until the capstan has definite dull rubber finish. Any glaze must be removed in order to operate reliably.
4.4 If the glaze cannot be removed, follow the specia Glazed Capstan Cleaning procedure on page 08-700

5. FILE REEL HUB
5.1 With a lint-free cloth dampened with tape cleaner use a light pressure to clean the following
5.1.1 Back rubber flange V .
5.1.2 Rubber ring $\mathbf{W}$ or rubber pads on some models.
6. CARTRIDGE RESTRAINT
6.1 Use a lint free cloth to clean lower restraint This metal is porous and the air flow can be estricted by using fluids or abrasive materia during cleaning.

3803/3420 PREVENTIVE MAINTENANCE SCHEDULE
3420 Tape Unit

| Code |  | Location Operation | Frequency | Action |
| :---: | :---: | :---: | :---: | :---: |
| U | R |  |  |  |
| 0 |  | Door Slide and Stop Pin | 4 months | Lubricate the door slide and the stop pin with IBM \#17. |
|  |  | General Cleaning | 4 months | 1. Clean front deck and base. <br> 2. Remove tape cleaner block and clean with tape cleaner. <br> 3. Remove air bearing (D bearing) next to EOT/BOT block and clean. Inspect guide behind bearing and replace if grooved. <br> 4. Clean NRZI guides. <br> 5. Clean EOT/BOT channel mirror. <br> 6. Clean the fiber optic lamp. Use a tissue lightly moistened with water. <br> Caution: Allow lamp to cool before cleaning. <br> Remove the manifold and fiber bundles to provide access to the lamp. Replace the lamp (08-620) if it is not clear. Note: Cleaning or optic lamp may require the readjustment of the EOT/BOT and capstan squaring. |
|  |  | Capstan Tach Squaring Circuit | 4 months | Check and adjust Capstan Squaring. See 08-120 or 08-130. Ensure capstan is free from dents and does not bind. |
|  |  | Capstan Tracking | 4 months | Check and adjust Capstan Tracking. See 08-000. |
|  |  | EOT/BOT | 4 months | Check and adjust EOT/BOT. See 08-580. |

| Code |  | Location Operation | Frequency | Action |
| :---: | :---: | :---: | :---: | :---: |
| 0 | R |  |  |  |
|  |  | еот/bот | 12 months | Remove EOT/BOT by emoving the two screws and gently move block forward being careful not to damage the fiber bundles if present. Clean EOT/BOT with a cotton swab dampened with tape cleaner. Replace EOT/BOT block. |
|  |  | Capstan Motor Mod-8 | 12 months | Clean screens on back of motor with vacuum cleaner. |
|  |  | Radius Sense | 12 months | Clean the ends of the fiber optic bundle if present with a damp cloth, see 08-610 for removal. Apply a felt pad to the handle and lightly dampen with tape cleaning fluid. Hold pad to the inside front of left reel flange and spin by hand. This will clean the reflective strips located inside the left reel. |
|  |  | Reel Tach | 12 months | Check reel tachs for glaze. Replace reel tachs if glazed. |
|  |  | $\begin{aligned} & \text { Glass Bead } \\ & \text { Tape } \end{aligned}$ | 12 months | Inspect glass bead tape on stubby bar and in vacuum columns. See note. Ensure that stubby bars are not loose and have proper clearance. See 08-000. |
|  |  | High Speed Rewind Plunger | 12 months | Check operation of the High Speed Rewind Plunger. (08-000) Models 3, 5 , and 7 only. |
|  |  | Autocleaner Check | 12 months | 1. Check operation of autocleaner by marking the ribbon and observing tibbon should m. The bottom to top. <br> 2. Check the supply of autocleaner ribbon. Order a new autocleaner cartridge when approximately $3 / 4$ inches of ribbon is visible through the cartridge window. Models 4, 6, and 8 only. |
|  |  | Preamps | 12 months | Check and adjust preamps (08-290 or 08-300). |

| Code |  | Location <br> Operation | Frequency |
| :--- | :--- | :--- | :--- | Inspect the

columns.
Replace if the glass bead is nicked, scratched, burred or has an eea obviously won to the touch. (Iff not obviously worn, do no eplace).
Run finger on the glass bead surface at the bottom of the vacuum eference.

A worn glass bead surface will cause tape motion problems.

## 3803 Control Unit

| 0 |  | Air Filter | 2 months | Check cooling air filter for <br> restriction of ar ar flow. Clean <br> or replace as required. |
| 2 |  | dc Voitage | 6 months | Check dc voltages. Adjust as <br> required to the levels <br> specified on decals. |

## INTRODUCTION

This section contains installation instructions for the IBM 3803 Model $2 / 3420$ Magnetic Tape Subsystem. IBM 3803 Model $2 / 3420$ Magnetic Tape Subsystem.
Companion publications pertaining to this product are:

1. 3803 Model $2 / 3420$ Subsystem Description GA32-002 1
2. 3420 Model 4, 6 and 8 Parts Catalog, S132-0007
3. 3803 Models 1 and 2 Parts Catalog, S132-0004
4. 3420 Operator's Guide Card, S232-0003
5. 3803/3420 OLT Users Guide

Safety Note: Ensure your own safety by using caution at all times and by being aware of potentially dangerous areas of the machine. Read and follow the safety suggestions in Form 229-1264, a pocket-sized card issued to all customer engineers and reprinted at the front of
this manual. this manual.
Caution: No portion of this procedure is to be omitted. Perform all steps including checks and adjustments.

## INSTRUCTIONS

Perform the following basic steps for each 3803 Model $2 / 3420$ installation, regardless of the subsystem configuration:

1. Refer to the checklist on 90-020 and initial each box when an installation procedure is completed.
2. Complete the configuration worksheet on 90-040. Refer to the instructions on 90-030.
3. Unpack units. (See Unpacking Instructions on this page.
Note: Before moving 3420 tape units into place, be sure to remove packing tape from the air flow mercury switch and install the front kickplate. Check ESD grounding. See 90-190, F7 and F8 before moving machines into place.
4. Remove the wire seal from the 3803 and 3420 's, 90-180, only at this time.
5. Install four caster locks.
6. Install front and both side kickplates. See 90-090.
7. Install rear kickplate. See 90-090.
8. Install and plug cables. See $90-050$ through 90-080.
Note: The tag and bus cable pairs must be of equal length. Paired cables of unequal length cause timing errors resulting in hard-to-diagnose subsystem problems.
9. Plug address/feature/priority card jumpers to match configuration requirements, see 90-110.

Note: Check the factory-installed items such as card jumpering, and all card and cable seating. Particularly check the write head and read head card seating 10. Rework the 3420 Field Tester, see 90-170.

Note: Make sure customer's power matches subsystem requirements. Check for correct blower and motor rotation.
11. Perform power supply checks and note special tape unit power supply requirements, see 90-180
12. Perform all checks and adjustments on 90-190.
13. Run system diagnostics on 90-200. (Refer to User's Guide.)
14. If any Emulator is run on a $S / 360$, install jumper, see 90-200.
15. Generate a read only tape, on 90-200.

Note: It is possible to combine 3803 Models 1 and 2 in one subsystem. Be sure your customer 2 in one subsystem. Be sure your customer cannot address any 3420 Models 4, 6, or 8 tape units.

## UNPACKING INSTRUCTIONS

Unpack tape control and tape units.
Refer to Unpacking Instructions, which are in a plastic envelope attached to each unit. Move discarded packing material away from work area. File Unpacking instructions for future reference if tape subsystem is to be moved.

## CHANNEL ATTACHMENT

The 3803 Model 2 at 6250 bpi will attach to these ystems via the indicated channels:

| System | $3420-8$ | $3420-6$ | $3420-4$ |

## CONFIGURATION WORKSHEET

## INSTRUCTIONS

Complete the configuration worksheet on Page 90-040 for your installation. Check customer requirements before configuring each system. When installation is completed, place worksheet in the front of subsystem ALDs and keep as a subsystem cabling history.
Complete all applicable blocks in the worksheet for each 3803 tape control:
1 Indicate each 3803 serial number in decimal
$[2$ Indicate processing unit/Channel identity and cable numbers.

3 Assign an address to each 3803 tape control in hex (bits 0-4, Example: 18X/3BX).
4 Assign "Select Out" priority ("high"/"low") for each interface by checking applicable box.
5 Indicate features installed on each 3803 tape control.
6 Assign 3420 addresses to each 3803 . Check the 0-7 (low order) block on one "host" 3803, and the 8-F (high order) block on the other "host" 3803.
7 Draw in cabling for your configuration and insert cable key numbers.

## SECTION A: DEVICE SWITCHING

## feature

A-1 Tape subsystem configuration flexibility is provided by field-installable switching features that allow up to 16 tape units to be switched between four tape controls. The three device switching features available with the tape subsystem are:
2 Control Switch ( $2 \times 8$ or $2 \times 16$ configuration, see Figures 1 and 4 on page 90-051)
3 Control Switch ( $3 \times 8$ or $3 \times 16$ configuration, see Figures 2 and 3 on page $90-051$ )

4 Control Switch ( $4 \times 8$ or $4 \times 16$ configuration, see Figures 5 and 6 on page 90-052)
A 3803 must have a Communicator installed in order to be switched. The Communicator sends tape unit selection and device interface signals to tape units 0 through 7 or 8 through $F$ are being addressed. The location of the device switches depends on the configuration desired. For example: In a 2,3 , or $4 \times 8$ configuration, the switching feature is required only on the first 3803.

The Communicator is installed by removing the selection logic circuits and the associated device selection logic circuis and the associated device circuitry and cables to the device switches are then installed.
Using a combination of the Communicator and the 2, 3, or 4 Control Switch, two, three, or four interconnected tape controls can address a maximum of 16 tape units. Figures 1 through 6 rations and cabling.

Note:
[1] The dark gray end of the signal cable is indicated by the arrow tip. (See Figure 1 90-060.)

## SUBSYSTEM INSTALLATION (Cont'd)

## SECTION B. SUBSYSTEM CABLING

B-1 Unpack the interface and power cables and lay in place.
Refer to the "Key Number" or "Connector ID" Refer "Xo the "Key Number or "Length" shown on each interface cable label when placing cables (see Figure 3).

Refer to power cable connector (see Figure 2) to ensure that power cables will be located correctly.
Caution: Ensure that the color scheme on the connectors is followed.
B-2 Plug Cables and Terminators
a. Plug cables at tape control and tape units. Each tape unit's address is determined by the position on the tape control interface panel to which its signal cable is connected.
Caution: Do not connect 3803 power cable to customer's receptacle at this time.
b. Insert terminators in "outgoing" cable positions in subsystems where "outgoing" cables 132 and 133 are not used
c. Install cable retaining bars when cabling is complete.
B-3 Observe 'from' and 'to' designations given in Figure 1, Page 90-070. Red or red-striped labels indicate 'from' end of cables; white labels indicate 'to' ends of cables.

Figure 3. Dimension Explanation " $x$ " Dimension $=$ Distance Between Cable $Y " \& " Z " ~$

| * Tape operations allowed only when all other byte channel devices are quiesent. |  |  |  |

## Notes:

[1] To attach eight or less tape controls to one channel, the last tape control must be attached to the channel with a sum of no more than 200 feet $(61,0 \mathrm{~m})$ of cable. If the tape control is attached to a $3420-6$, subtract 15 feet $(4,5 \mathrm{~m})$ for each intervening control unit between the channel and the last tape control. If the tape control is attached to a $3420-8$, subtract 20 feet $(6,1 \mathrm{~m})$ for each intervening control unit between the channel and the last tape control (see Note 10). For cabl length limitations when attaching a 3803-2 at 6250 BPI , see Figure 2.
[2] Sequence and Control (EPO).
[3] Channel to channel adapter (Sales Feature 1850).
[4] Total cable length from a 3420 tape unit to the most remote 3803 tape control must not exceed 120 feet $(36,6 \mathrm{~m})$. (Group 129 or 142 , or 143 , plus group 136-141.)
[5] Includes both signal and power cable. A maximum of eight 3420 tape units can be connected to each 3803 Tape Control 1 and 2. Tape units cannot be connected to tape control 3 and 4 for power requirements unless they are used with cable group 144.
[6] Parenthesis indicates cables to be used in World Trade countries for 60 Hz machines.
[7] When the number of 3420 s to be connected to a 3803 Model 2 exceeds the limitations of power ( 60 Hz ), each extra 3420 tape unit may be supplied power by another 3803 tape control using cable group 144. Cable group 143 is available to signal attach tape units using cable group 144 With SF9001 installed, the 3803 Model 2 may power a total of eight 3420s (any model).
[8] For use with remote channel switch special feature.
[9] Part number 5466456 ( 24 Signal) may be substituted for 5353920 (20 Signal) for cable group numbers 130, 131, 132 and 133.
[10] Terminators are required when the 3803 is the last control unit in a chain or the only control position) or 2282675 ( 24 position) bus posininators and either 5808324 (20 pus terminators and either 5808324 ( 20 position) or 2282676 ( 24 position) tag terminators as determined by the number of signal lines per
cable.

## Example:

200 feet $(61,0 \mathrm{~m})$ (Maximum 200 feet $(61,0 \mathrm{~m})$ per Figure 2)
-30 feet $(9,0 \mathrm{~m})(T w o$ intervening $\mathrm{CU}=2 \times-15 \mathrm{ft})$
170 fer
170 feet ( $52,0 \mathrm{~m}$ ) Maximum cable length that can be used

## C C C C C C C C C C C C C C C C C C C C C C SUBSYSTEM INSTALLATION (Cont'd)

SECTION B. SUBSYSTEM CABLING (Cont'd)

Caution: Refer to ALD AA005 Feature Plug List before installing a replacement logic board. Notes:
Two-channel switch diagnostics AD through AG can only be run when both channel interfaces are cabled to the same central processing unit. If it is necessary to run diagnostics $A D$ through $A G$ during initial checkout, plan temporary cabling to meet this requirement.
[1] Both EPO cables must be plugged if the two channel switch feature is installed, and the two channels are not on the same processing unit or not on the same channel frame. Remove any temporary jumper plugs.
[2] For cable, part 5466456 ( 48 pin), use terminator, part 2282675 (bus) and 2282676 (tag)
For cable, part 5353920 ( 40 pin), use terminator, part 5440649 (bus) and 5440650 (tag).
[3] Panel Y 1 is located in position 01A-A3 unless the 3803-2 has optional features installed. On feature machines, panel Y 1 is located in positon $01 \mathrm{X}-\mathrm{Y}$
[4] For cable group number, key number, part number to and from relationship, see Figure 1 on 90-070.

* Cables plugged when the two-channel switch feature is present.

## SECTION C. KICKPLATES

C-1 Install 3803 front and rear kickplates and 3420
rear kickplates as shown in Figure 1.

1. Attach pins, nuts, and retaining clips to front and rear frame members of the 3803 and rear frame member of each 3420 as shown in Figure 1.
2. Mount kickplates by pushing brackets onto pins. Clips must be positioned below lower flange of brackets.
Note: Leave 3420 rear kickplates off until cabling is complete.
3. Turn nuts on pins to level kickplates.
4. If necessary, realign 3803 covers after kickplate installation.

C-2 Install 3420 front kickplates as shown in Figure 2.

1. Install front kickplates before moving tape units into place.
2. Elongated holes in the bracket allow kickplate to be leveled and adjusted to clear the front cover

Figure 1. 3803 (Front and Rear Kickplates) 3420 (Rear Kickplates)

## sUBSYSTEM INSTALLATION (Cont'd)

## SECTION C. KICKPLATES (Cont'd)

C-3 Install 3803 and 3420 side kickplates as shown in Figure 3.

1. Install side kickplates only on the machines at each end of a group. Use screw P/N 731629.
2. Open or remove covers to attach kickplates. Use 12 -inch ( 305 mm ) kickplate, part 2501286 (notched corner), on cover adjacent o tape unit power door hinge. Use 13 $1 / 8$-inch ( 333 mm ) kickplate, part 5356406 , on remaining side covers for 3420 tape units and 3803 tape controls.

C-4 Typical Subsystem Configuration
Sufficient side kickplates, parts 2501286 and 5356406 , are shipped for the configuration shown in Figure 4. Kickplates are not provided for installation between adjacent tape units. Order additional side kickplates by MES, if needed for other configurations
C-5 Install caster locks (4each), P/N 280336.

Figure 3. 3803, 3420 Side Kickplates

D-4 Features (when applicable to your machine):
a. Two Channel Switch Feature: Verify factory plugging.

b. Two-channel switch feature ( 3803 Address Channel "B"): Verify factory plugging.

c. NRZI Feature: Verify factory plugging

## 3803-2/3420

## SECTION D. TAPE CONTROL <br> ADDRESS/FEATURE/PRIORITY CARD <br> PLUGGING (Cont'd)

D-5 Primary/Secondary Tape Unit Interface Control:
a. With device switching capability.

b. With selection logic ( $1 \times 8$ )

## D-6 a. Data In Handling: S/360 or S/370

Card row

Note: Data Flow Check asymmetry. Do not change jumpers unless card is replaced. This is a factory adjustment only.
b. If you have Selection Logic ( $2 \times 8$ ), go to step $\mathrm{D}-9$ on page $90-160$, if device entry, else go to 90-180.
If you have $2 \mathrm{x}, 3 \mathrm{x}$ or 4 x switch, proceed to step D-7 on page 90-140.
.
*360 Plug 360 if the attached channel does not have data in/data out capability.
**370 Plug 370 if the attached channel has data in/data out capability.
If attached to a 2880 channel, bus out checks may occur if channel timings are not optimized. The 2880 must be at EC718040 level or higher.
*W/O 2CS—Channel B may be plugged to 360 or 370 since it is not used.

SECTION D. TAPE CONTROL
ADDRESS/FEATURE/PRIORITY CARD
PLUGGING (Cont'd)
D-7 Tape Switching Feature Address Control: Change or verify jumper plugging of host 3803 tape controls only

1. For installations with less than a full
complement of 3420 tape units (for example, $2 \times 12$ ), plug all cards present as if the non-existent tape units had addresses assigned to them.
Jumper cable locations for switch cards:
2. As each switch card is pulled, refer to the chart on Page 90-150 and verify that device selection priority assignments are correct.

3803-2/3420

| XJ0800 | 2736027 | See EC History | $845958$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

SECTION D. TAPE CONTROL

## ADDRESS/FEATURE/PRIORITY CARD

## PLUGGING (Cont'd)

D-8 Device Selection Priority Assignments: Verify that factory plugging of priority jumpers on the switch cards is correct.

## Plugging Rules:

. A priority must be assigned to each set of cards.
2. No duplication of priority should exist between sets of cards in one 3803 tape control.
3. All cards must have T23-U23 connected by a jumper wire.
4. Factory plugging for these cards should be as shown, and should not have to be changed for any installation.
5. This plugging establishes priority; if two 3803s try to access the same 3420 tape unit simultaneously the 3803 with the least number of jumpers will take control.

3803 Switch Path "C

803-2/3420

| $\begin{aligned} & \text { XJ0 } \\ & \hline \end{aligned}$ | $\begin{aligned} & 2736027 \\ & \text { Part Number } \end{aligned}$ | See EC History | ${ }^{845958}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## C Cubsystem installation (Conted)

SECTION D. TAPE CONTROL ADDRESS/FEATURE/PRIORITY CARD PLUGGING (Cont'd)

D-9 Apply labels to tape control operator's panel as shown.
a. Operator's Panel Labels

For the 3803 that "hosts" tape units 0-7:

1. Use labels furnished to indicate addresses of tape control associated with each group of operator panel switches
2. Apply 3420 address labels $0-7$ above each group of switches as shown

b. Operator's Panel Labels For the 3803 that "hosts" tape units 8-F:
3. Use labels furnished to indicate tape control addresses associated with each group of perator panel switches.
4. Apply 3420 address labels $8-\mathrm{F}$ above each group of switches as shown.

## FIELD TESTER CONVERSION

Do the following rework to make the field tester compatible with 3420 Models 4, 6, and 8. The new EC Level is 734316 . (The field tester remains compatible to 3420 Models 3, 5, and 7.)

1. Remove the four screws from the bottom of the tester. Then remove the cover. Check the probe side of the card/connector socket block
a. If connections are made by means of a printed circuit card, replace the cover and four retaining screws, then skip to step 7.
b. If connections are made by means of wire wrapping, proceed to step 2.
2. Remove the logic card, unplug the signal cables, and slide the connector block out.
. Delete yellow wire from B1G02 to A2B13.
3. Add \#30 gauge SLT wire from B1J05 to A2B13.
4. Reassemble the tester: slide the connector block into the tester, plug the cables, and install the logic card.
5. Replace the cover and the four retaining screws.

7 Install label, part 1845758, to the right of the data rate switch $(8,16,32)$ as shown
© Install label, part 1845760, over the existing instructions (1-3) on top of the tester.
9. Before converting a Model 3,5, or 7 tape unit to a Model 4, 6 , or 8 , take the tape unit offline. Then connect the field tester.
Note: Simulate a Model 4, 6, or 8 by grounding N5B02 on the tape unit.
10. Mount and load a CE work tape. Then set the field tester to WRITE CONTINUOUS. See 80-020.
11. Scope test point A1H1B11 (-WRITE DATA TRACK P), at the tape unit. Observe a full write cycle period and compare to the chart below. Make sure the data rate switch is set correctly for the tape unit model being used.
Note: Times are nominal and are given in microseconds. Tolerance is $\pm 5 \%$

| Model | Data Rate Switch Position |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{8}$ | $\mathbf{1 6}$ | $\mathbf{3 2}$ | $\mathbf{6 4}$ |
| 3 | 32.8 | 16.4 | 8.2 | - |
| 4 | - | 16.4 | 8.2 | 4.1 |
| 5 | 20.0 | 10.0 | 5.0 | - |
| 6 | - | 10.0 | 5.0 | 2.5 |
| 7 | 12.4 | 6.2 | 3.1 | - |
| 8 | - | 6.2 | 3.1 | 1.6 |

Note: Take any 3420 tape unit Incident Report (IR) and code your time, using Service Code 33, ECA \#991.

```
1. Unload drive before plugging or unplugging tester.
2. Place tape unit in off-line status.
```

4. Jumper K2P02-M2D06 for 6250 operation.

## SECTION E. POWER SUPPLY CHECKS

E-1 Remove the wire seal from the 3420 tape unit $J 1$ power connector, and the wire seal from around the 3803 Model 2 power plug.
E-2 With power off, check the 18 filter capacitor mounting screws on the 3803 Model 2 tape ontrol's $+6 v$ and $-4 v$ power supplies. If loose ger-torque and damage the power board ver-torque and damage the power board. Also connections. (See 08-575.)

E-3 With power off, check that the customer's supply voltage matches that shown on the voltage rating label

Note: To connect a 3803 tape control for operation at a different input voltage, refer to

3803 logic page YFO10 ( 60 Hz ) or YFO15 $(50$ Hz ).

See Page 08-570 to determine if each tape unit has a modified power supply. Then, refer to logic pages listed for the connections to be changed:

## Frequency Logic Pages Affected

(Model 3, 5,
60 Hz
YBO
$50 \mathrm{~Hz} \quad \begin{gathered}\text { YB010*, } \\ \text { YBO15*, } \\ \text { YBO2O\#, } \\ \text { YBO25\#, YBO30\# }\end{gathered}$
(Model 4. 6, 8)

- For tape units with "Modified"
\# For all tape units.
E-4 Customer Power Phasing
Check three-phase ac power receptacles to ensure proper motor rotation in each unit. Any improper phasing must be corrected before power is applied to the subsystem
E-5 With power on, check that all blowers and motors operate correctly.
a. Incorrect phasing of input voltage causes the tape unit pneumatic supply motor to turn backward, preventing the tape unit from ading.
b. The cooling fan assembly blower motor in the tape unit will run backwards. Remove filter from machine and observe the direction of the fan as power is dropped. Fan should turn clockwise when viewed from below. (See arrow.)
Note: All blowers in the tape control are single phase.
E-6 Mount and load a tape. Using a Digital Voltmeter, part 453585, 453046, or equivalent velies are within the tolerances listed supplies are within the tolerances listed:

| Tape | Unit Models 3, 5, and 7: Test Point | Tolerance (Note 1) |
| :---: | :---: | :---: |
| ${ }_{4.05 v}^{6 v}$ | A1G1E09-A1G2D08 A1N3D02-A1N3D08 | $\begin{aligned} & \pm 0.1 v \\ & \pm 0.05 v \end{aligned}$ |
| 3420 Tape | Unit models 4, 6, and 8: Test Point | Tolerance (Note |
| -6v | A1G2B11-A1G2DO | $\pm 0.1$ |

+6v A1G2B11-A1G2D08
$\stackrel{ \pm 0.1 \mathrm{v}}{ \pm 0.05 \mathrm{v}}$
Note 1: Ripple specifications for -4 v and +6 v are 24 mv peak-to-peak. Measure at power supply. Refer to DC Logic page
for your machine for TB locations. (YBO2O, YBO25 or YFO2O YFO25)
3803 Tape Control
Test Point
6v B2S2M11-B2S2DO8
Tolerance (Note 2)
$4.0 \mathrm{v} \quad$ A2T4BO6-A2T4DO8 $\quad \pm 0.01 \mathrm{v}$
Note 2: Ripple specification for -4 v is 80 mv peak-to-peak and for
-6 v is 10 mv peak-to-peak. Measure at power supply
Caution: A ground loop has been purposely installed in the 3803 tape control for electro-static discharge (ESD) control. The installed ground loop is in the tape signal tail ock for
位
ed at the factory for ground loops.

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## SECTION F. CHECKS AND

## ADJUSTMENTS

Note: Make sure the write head card is seated properly before continuing.
This section outlines checks, adjustments, and tests to ensure that the tape units and tape controls operate normally when the subsystem is turned over to the customer. See "Checks, Adjustments, Removals, and Replacements" sections of this manual for details.
F-1 Altitude Vacuum Level Setting-3420
Using a water manometer with a pressure divider: or a pressure/vacuum gauge, part 5495384 , measure the vacuum according to the decal on
the transfer valve. If incorrect:
a. 3420 Models 3 through 7 :

Check that the vacuum pump belt and transfer valve plug are set as shown in 08-4 10 .
b. 3420 Model 8 only:

Adjust vacuum line restrictor to obtain vacuum
shown in 08-410.
F-2 Regulator Air Pressure- 3420
Check/adjust pressure as shown in 08-405.

## F-3 Capstan-3420

Caution: Allow fiber optics lamp to warm up 20 to $\mathbf{3 0}$ minutes before making adjustments
Do capstan tach adjustment. See 08-130 for Do capstan tach adjustment. See $08-130$ for
models $3,5,7$ or $08-120$ for models $4,6,8$
F-4 Mechanical Skew-3420
a. Visually check tracking before adjusting the skew plate. Perform procedure on page $08-150$ or 08-160.
b. Check that mechanical skew meets the specifications given in 08-170 (1600 and 6250 bpi) or 08-180 (NRZI).
F-5 BOT/EOT-3420
Caution: Allow fiber optics lamp to warm up

## 20 to 30 minutes before making the

## adjustments.

Verify BOT/EOT adjustment. See 08-580.

F-6 Autocleaner Tape Direction-3420
Caution: Do not check autocleaner until tape unit has been positioned online, and just prior to returning machine to customer

Check that autocleaner tape moves from bottom to top by marking tape and observing direction. See 08-380, "Autocleaner Operational Check'

F-7 ESD Grounding - 3420 and 3803
Check that each door strike and roller assembly is adjusted correctly to ensure sufficient
electro-static discharge (ESD) grounding.
3420 lower rear door (1).
3803 upper and lower on the front and rear doors (4).
This adjustment is accomplished as follows:
a. With the screws loose, adjust the roller assembly so the door roller will latch on the strike plate.
b. If necessary, adjust the plate mounted between the strike and frame to ensure proper grounding between the plate and finger stock assembly.
Note: Check that the door latching adjustment is Note: Check
still correct.
F-8 ESD Grounding-3803
a. Check the adjustment of the ESD plates on both the left and right sides. Be sure the plates are installed with the hem toward the inside of the machine.
Caution: Be sure that the plates are not adjusted to bow too much because the plates will reverse bow when the door is closed and lose proper grounding.
b. If necessary, adjust the plates so that each one bows out sufficiently to make contact with the hat section of the side cover
c. Check the side door latch for a firm latching and adjust, if necessary.
F-9 Data Flow Clock Asymmetry
Adjustment-3803
If the A1C2 card is replaced in the 3803, see
ALD AAO10 sheet 2 of 3 , for adjustment procedure. (Originally factory adjusted.)

3803-2/3420

## subsystem installation (Conted)

## SECTION G. SYSTEM DIAGNOSTICS

Note: Make sure the write head card is seated properly before continuing.
G-1 Run 3420 OLTs $A-K, M-X$ and $A B$ through AG. (AB) through AG must be run under OLTSEP. AB is diagnostic for 3803s with a device switching feature. AD through AG are optional for 3803 s with the two-channel switch feature. (You must through AG.)
Note: OLT section 3420L will run only under sense switch setting (3420L/EXT=9). Verify PE clipping levels on machines with PE feature.

G-2 Verify serial numbers, EC levels, and features from the diagnostic printout.
a. If the tape control information is incorrect, see plugging chart on $90-210$, or AA010 in the 3803 ALDs.
b. If the tape unit information is incorrect, see plugging chart on 90-210, and 90-212 or A6106 in the 3420 ALDs.

G-3 When the diagnostics have run error free, generate and save for future use a read only tape in 6250 bpi mode.
a. Enter the following as shown
r 01,'DEVICE/3420A-G/fe,ext=z/'
b. To ensure that a good tape has been generated, the program must run without error. When a good tape has been generated, remove the write enable ring.
c. Mark this reel 6250 bpi READ ONLY and save for diagnostic use with Section 00-010 of the MLMs

Note: The CE should retain the output from Sections " $V$ " and " $W$ "' of the OLTs which will give printed table listing of all tape unit performance measurements.

EMULATOR: (If applicable to your machine)
If the 3803 is attached to a System / 360 on which any emulator is run, install a jumper on each tape unit to disable LOAD FAIL IRPT

420-3, 5, and 7, between A1H2U12 and
A1H2U08
3420-4, 6, and 8, between A1M2U12 and A1M2U08

## SECTION G. SYSTEM DIAGNOSTICS <br> (Cont'd)

G-4 Tape Control Serial Number/EC Level/Feature
Code: Verify from diagnostic printout that factory
Code: Verify from diagnostic printout that fact

Plugging example: tape control serial number is
10430, with 9-track feature.
