APPENDIX

Rl	Available Memory Configurations
R2	Instruction Set Numerical Order
R3	Instruction Set Functional Order

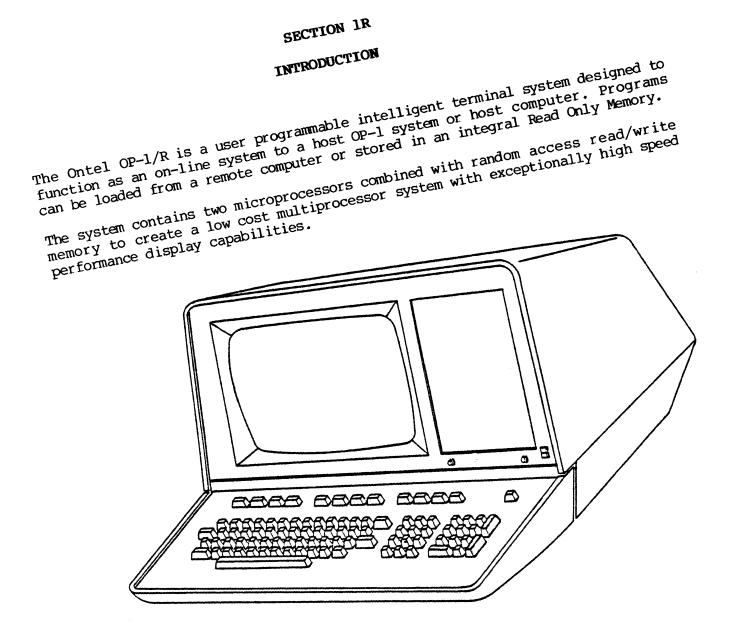

Figure 1R-1. OP-1/R Configuration

The Central Processor Unit can be programmed by the user for any application. The input/output disciplines are program controlled and enable the system to operate with various host computers.

The Display Microprocessor provides a movable window in memory and performs fast roll/scroll and erase operations, as well as display functions such as blinking and video reversal.

The system features include random access memory available in various configurations; program controlled asynchronous communications up to 19200 bits-per-second; a 14 inch non-glare CRT; and a complete programmable keyboard, arranged in four functional sections that generates unique codes readable by the CPU.

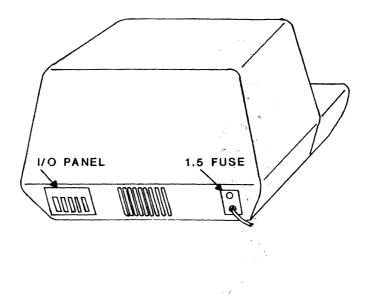

Figure 1R-2. OP-1/R Rear View

There are four versions of the OP-1/R. The OP-1/R Standard, OP-1/R II, OP-1/RW and the OP-1/RS. See Figure 1R-3 for summary.

All Boards include:

- a) 8085 CPU
- b) 4K, 8K, 16K, or 32K DYNAMIC RAM
- c) Up to four 2708, 2716 or 2732 ROM, PROM or EROM
- d) Parallel I/O
- e) Two Fixed Data Switches
- f) Support for Alternate I/O Adapter (Optional second board).

FEATURES

OP-1/R STANDARD (5100-1101)

- 24 Line Display
- Async Communications RS-232, Current Loop or 2 Wire Direct. Programmable up to 19.2K BAUD.
- Will not support IOM and Device Controller.

OP-1/R II (5100-1108)

- Same as Standard but will support IOM and Device Controller.

OP-1/RW (5100-1109)

- Async Communications RS-232, 2 Wire Direct. Programmable up to 19.2K BAUD.
- Word Processing Display.
- Support IOM and Device Controller.

OP-1/RS (5100-1110)

- Synchronous Communications RS-232. Programmable up to 19.2K BAUD.
- 24 Line Display
- Support IOM and Device Controller.

IOM AND CONTROLLERS

The following controllers can be used on the OP-1/R. Refer to OP-1 Reference Manual.

Word Move Controller I	5000-1170
Word Move Controller II	-11101
Synchronous Communications I	-1104
Synchronous Communications II	-1193
Bisynchronous Communications I	-1148
Bisynchronous Communication II	-1192
Asynchronous Communications	-1134
Diskette Controller	-1135
MPDC II Controller	-11110
Mini Diskette Controller	-11118
SDLC	-11106

These PC Boards are identical to OP-1 Device Controllers except for the additional connection of signal $\overline{\text{SEL}}$ to I/O Pin 4.

SECTION 2R

SYSTEM ARCHITECTURE

The OP-1/R system is designed for high speed communications and interactive display capability. The system memory is shared by two or three micro-processors:

- 1. Central Processor Unit
- 2. Display Microprocessor
- 3. Optional Input/Output Microprocessor

Figure 2R-1 illustrates the system architecture.

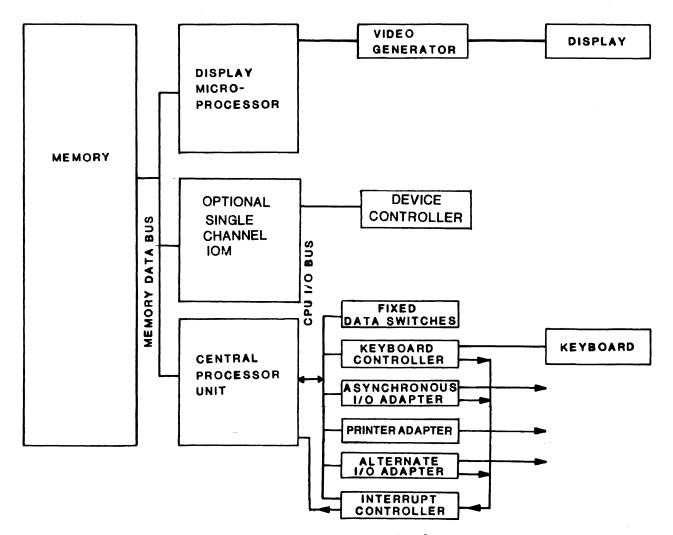

Figure 2R-1. OP-1/R System Block Diagram

MEMORY

Random access 8-bit byte memory is used. Various combinations of Read/Write or Read Only Memory are available. Bootstrap memory is available for systems equipped with only Read/Write main memory.

The memory can be allocated to any use at the programmer's option for program storage, display or I/O buffers.

CENTRAL PROCESSOR UNIT

The Central Processor Unit (CPU) performs the control, arithmetic and logic functions of the OP-1/R. An 8-bit parallel microprocessor with interrupt capability is used as the Central Processor Unit. A bi-directional data bus is used for communications between the CPU, memory and I/O devices.

The instruction repertoire includes Arithmetic/Logic Instructions, Load, Increment/Decrement, Rotate, Jump, Call and Return instructions.

DISPLAY MICROPROCESSOR

The Display Microprocessor converts the OP-1/R memory into a continous display page. The display screen is a movable window in the page. Any section of the memory can be assigned as a display buffer. Over 400 lines with 80 characters each can be implemented in a 32K byte memory system.

A detailed description of each device controller and device is supplied in the appropriate section.

INPUT/OUTPUT MICROPROCESSOR

Refer to Section 13.

SECTION 3R

CENTRAL PROCESSOR UNIT AND I/O BUS

This section describes the CPU and the Instruction Repertoire. The basic devices directly connected to the CPU I/O bus: Fixed Data Switches, Keyboard and Asynchronous I/O Adapter, Printer Adapter and Alternate I/O Adapter are described in later sections.

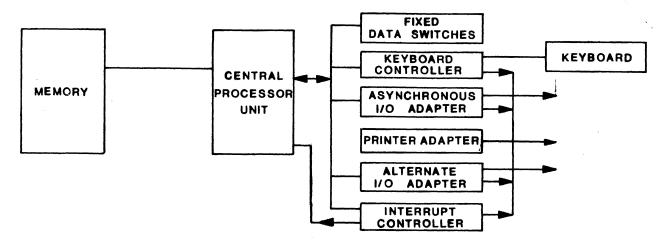

Figure 3R-1. CPU and I/O Bus

CENTRAL PROCESSOR UNIT

The CPU consists of an Arithmetic/Logic Unit, five condition flags, seven general purpose 8-bit registers, and a pushdown stack pointer and a program counter, each 16 bits long. The CPU is capable of directly addressing up to 64K bytes of main memory.

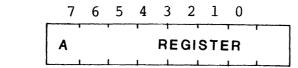

ARITHMETIC/LOGIC UNIT

The Arithmetic/Logic Unit is an 8-bit parallel binary computation device that performs addition, subtraction and logical operations.

All individual register arithmetic and logical operations are carried out between the A Register (Accumulator) and any one of the seven general purpose registers or between the A Register and memory. Register pair addition operations are carried out between the H and L registers and any one of the four register pairs.

GENERAL PURPOSE REGISTERS

Seven general purpose registers are used for temporary data storage internal to the CPU:

The A Register (Accumulator) receives the result of individual register arithmetic, logical and rotate operations. The A Register is also used as the Input/Output Register for data and control information exchanged between the CPU

Individual Registers

and the I/O Devices.

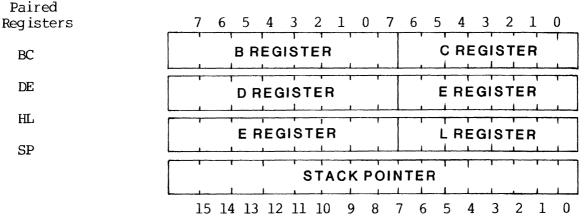

Accumulator

7 6 5 4 3 2 1 0 A,B,C,D,E,H,L REGISTER

The A, B, C, D, E, H, and L Registers can be used in conjunction with the Register for individual register arithmetic and logical operations. All registers are independent and can be incremented, decremented or loaded from another register or from memory.

	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	
Memory Addressing		-1		EC	101	ER	-1	T									
Registers	1				101					1		L	. RE	= GI	STI	= R ,	
M = (H L)	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

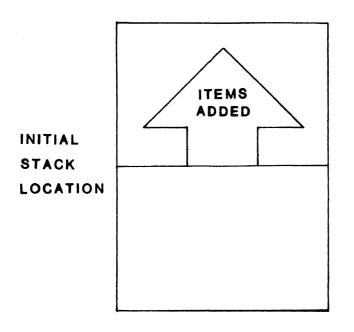

The H and L Registers, besides being used individually, are also used to provide memory addressing capability. The L Register contains the eight lower order address bits and H Register the eight higher order address bits of the memory location referenced. The contents of memory pointed to by the H and L registers are denoted by the letter M.

The individual registers can be concatenated in pairs to form a 16-bit register pair. The pair can be used to address memory or can be added to the HL pair. The standard names for the pairs are shown above.

THE STACK

A stack is an area of memory allocated for subroutine or interrupt linkage or for temporary storage. Various data bytes may be "pushed" onto the stack in sequential order and later "popped" or retrieved from the stack in reverse order. To keep track of the last byte pushed to the stack, a stack pointer is provided. The stack pointer (SP) is a 16-bit register which always stores the address of the lst byte in the stack. As illustrated in Figure 3R-3, a stack starts at its initial location and expands linearly toward lower addresses as items are pushed to the stack. It is the programmer's responsibility to initiate the stack pointer register and reserve enough room for stacking purposes so that pushing data to the stack never destroys other data stored in memory. Any portion of the memory can be allocated for stack purposes.

CONTENT OF STACK POINTER REGISTER DECREASES AS ITEMS ARE ADDED TO THE STACK

Figure 3R-3. The Stack

BOOTSTRAP MEMORY

When power is turned on, or the PROG key is depressed in conjunction with the SHIFT and CTRL keys, the CPU will execute the program starting at location 8000 of the memory. The OP-1/R can be equipped with a bootstrap memory that can be factory programmed to load a program from a communication line. Alternately, the OP-1/R can be equipped with a fixed program stored in a Read Only Memory (ROM).

THE OP-1R INSTRUCTION SET

The OP-IR instruction set includes six different types of instructions:

- * Data Transfer Group move data between registers or between memory and registers.
- * Arithmetic Group add, subtract, increment or decrement data in registers or in memory.
- * Logical Group AND, OR, EXCLUSIVE-OR, compare, rotate or complement data in registers or in memory.
- * **Branch Group** conditional and unconditional jump instructions, subroutine call instructions and return instructions.
- * Stack and Machine Control Group intructions for maintaining the stack and internal control flags.
- Input/Output Group instructions to select, input from or output to external devices.

Instruction and Data Formats:

Memory for the OP-1R is organized into 8-bit quantities, called Bytes. Each byte has a unique 16-bit binary address corresponding to its sequential position in memory.

The OP-1R can directly address up to 65,536 bytes of memory, which may consist of both read-only memory (ROM) elements and random-access memory (RAM) elements (read/write memory).

Data in the OP-1R is stored in the form of 8-bit binary integers:

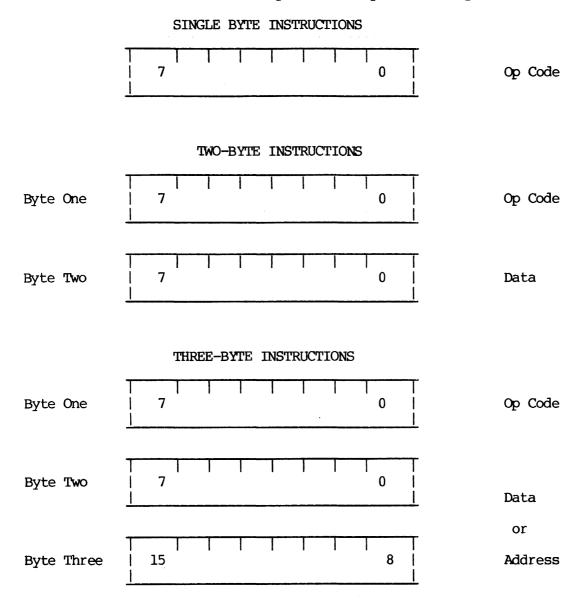

DATA WORD (byte)

T									T
	7	6	5	4	3	2	1	0	

MS	SB							LS	SB

When a register or data word byte contains a binary number, it is necessary to establish the order in which the bits of the number are written. In the OP-1R, BIT 0 is referred to as the Least Significant Bit (LSB), and BIT 7 (of an 8 bit number) is referred to as the Most Significant Bit (MSB).

The OP-1R program instructions may be one, two or three bytes in length. Multiple byte instructions must be stored in successive memory locations; the address of the first byte is always used as the address of the instruction. The exact instruction format will depend on the particular operation to be executed.

Addressing Modes

Often the data that is to be operated on is stored in memory. When multi-byte numeric data is used, the data, like instructions, is stored in successive memory locations, with the least significant byte first, followed by increasingly significant bytes. The OP-1R has four different modes for addressing data stored in memory or in registers:

- * Direct Bytes 2 and 3 of the instruction contain the exact memory address of the data item (the low-order bits of the address are in byte 2, the high order bits in byte 3).
- * Register The instruction specifies the register or register pair in which the data is located.
- * Register Indirect The instruction specifies a register pair which contains the memory address where the data is located (the high order bits of the address are in the first register of the pair, the low order bits in the second.)
- * Immediate The one or two bytes of data operated on by the instruction immediately follow the instruction in memory.

Unless directed by an interrupt or branch instruction, the execution of instructions proceeds through consecutively increasing memory locations. A branch instruction can specify the address of the next instruction to be executed in one of two ways:

- * Direct The branch instruction contains the address of the next instruction to be executed. (Except for the 'RST' instruction, byte 2 contains the low order address and byte 3 contains the high order address.)
- * Register Indirect The branch instruction indicates a register pair which contains the address of the next instruction to be executed. (The high-order bits of the address are in the first register of the pair, the low order bits in the second.)

The RST instruction is a special one-byte call instruction (usually used during interrupt sequences). RST includes a three bit field; program control is transferred to the instruction whose address is eight times the contents of this three bit field.

Condition Flags

There are five condition flags associated with the execution of instructions on the OP-1R. They are Zero, Sign, Parity, Carry, and Auxiliary Carry, and are each represented by a 1 bit register in the CPU. A flag is set by forcing the bit to 1; reset by forcing the bit to 0.

- Zero:If the result of an instruction execution has the
value 0, this flag is set; otherwise it is reset.Sign:If the most significant bit of the result of an
instruction execution has the value 1, this flag
is set; otherwise it is reset.Parity:If the modulo 2 sum of the bits of the result of
under the parity is a supervision execution is 0. (if the set is the
 - an instruction execution is 0, (i.e., if the result has even parity), this flag is set; otherwise it is reset (i.e., the result has odd parity).
- Carry: If the instruction execution resulted in a carry (from addition), or a borrow (from subtraction or a comparison) out of the high order bit, this flag is set; otherwise it is reset.
- Auxiliary Carry: If the instruction execution caused a carry out of bit 3 and into bit 4 of the resulting value, the auxiliary carry is set; otherwise it is reset. This flag is affected by single precision additions, subtractions, increments, decrements, comparisons, and logical operations, but is principally used with additions and increments preceding a DAA (Decimal Adjust Accumulator) instruction.

Symbols and Abbreviations

The following symbols and abbreviations are used in the subsequent description of the OP-1R instructions:

SYMBOLS	MEANING
accumulator	Register A
addr	16-bit address quantity
addr byte	low or high order byte of address, as indicated
data	8-bit data quantity

Symbols and Abbreviations - (CONTINUED)

SYMBOLS	MEANING
data 16	16 bit data quantity
byte 2	The second byte of the instruction
byte 3	The third byte of the instruction
r,rd,rs	One of the registers A,B,C,D,E,H,L
DDD,SSS	The bit pattern designating one of the registers A,B,C,D,E,H,L (DDD=destination, SSS=source):
	DDD or SSS REGISTER NAME
	111A000B001C010D011E100H101L
rp	One of the register pairs:
	B represents the B,C pair with B as the high order register and C as the low order register;
	D represents the D,E pair with D as the high order register and E as the low order register;
	H represents the H,L pair with H as the high order register and L as the low order register;
	SP represents the 16 bit stack pointer register.
RP	The opcode bits corresponding to a register pair, as follows:
	B - 00 D - 01 H - 10 SP - 11

SYMBOLS

MEANING

rh	The first (high order) register of a designated register pair.
rl	The second (low order) register of a designated register pair.
PC	16 bit program counter register (PCH and PCL are used to refer to the high order and low order 8 bits respectively).
SP	16 bit stack pointer register (SPH and SPL are used to refer to the high order and low order 8 bits respectively).
rm	Bit m of the register r (bits are number 7 through 0 from left to right).
Z,S,P,CY,AC	The condition flags:
	Z – Zero, S – Sign, P – Parity, CY – Carry, AC – Auxiliary Carry
()	The contents of the memory location or registers enclosed in the parentheses.
<	"Is transferred to"
AND	Logical AND
XOR	Exclusive OR
OR	Inclusive OR
*	Multiplication
+	Addition
-	Two's complement subtraction
<>	"Is exchanged with"
~	The one's complement (e.g., ~(A))
n	The restart number 0 through 7
NNN	The binary representation 000 though 111 for restart number 0 through 7 respectively.
W	(extra) Wait state for memory access

Description Format:

The following pages provide a detailed description of the instruction set of the OP-1R. Each instruction is described in the following manner.

- 1. The OP-1 assembler format, consisting of the instruction mnemonic and operand fields, is printed in **BOLDFACE** on the left side of the first line.
- 2. The name of the instruction is enclosed in parentheses on the right side of the first line.
- 3. The next line(s) contains a symbolic description of the operation of the instruction.
- 4. This is followed by a narrative description of the operation of the instruction.
- 5. The following line(s) contain the binary fields and patterns that comprise the machine instruction.
- 6. The last four lines contain incidental information about the execution of the instruction. The number of machine cycles and states required to execute the instruction are listed first. If the instruction has two possible execution times, as in a conditional Jump, both times will be listed, separately by a slash. Next, any significant data addressing modes (see Page 3R4) are listed. The last line lists any of the five Flags that are affected by the execution of the instruction.

Approximate Timing

The number of microseconds per instruction can be approximated as follows: # microseconds = (# CPU states)*(.32)

DATA TRANSFER GROUP:

This group of instructions transfers data to and from registers and memory. Condition flags are not affected by any instruction in this group.

Arithmetic Group:

This group of instructions performs arithmetic operations on data in registers and memory.

Unless indicated otherwise, all instructions in this group affect the Zero, Sign, Parity, Carry, and Auxiliary Carry flags according to the standard rules.

All subtraction operations are performed via two's complement arithmetic and set the carry flag to one to indicate a borrow, and clear it to indicate no borrow.

DAA (Decimal Adjust Accumulator)

The eight-bit number in the accumulator is adjusted to form two four bit Binary-Coded-Decimal digits by the following process:

- 1. If the value of the least significant 4 bits of the accumulator is greater than 9 or if the AC flag is set, 6 is added to the accumulator.
- 2. If the value of the most significant 4 bits of the accumulator is now greater than 9, or if the CY flag is set, 6 is added to the most significant 4 bits of the accumulator.

NOTE: All flags are affected.

BRANCH GROUP:

This group of instructions alter normal sequential program flow. Condition flags are not affected by any instruction in this group.

The two types of branch instructions are unconditional and conditional. Unconditional transfers simply perform the specified operation on register PC (the program counter). Conditional transfers examine the status of one of the four processor flags to determine if the specified branch is to be executed. The conditions that may be specified are as follows:

CONDITION	CCC
NZ - not zero $(Z = 0)$ Z - zero $(Z = 1)$ NC - no carry $(CY = 0)$ C - carry $(CY = 1)$	000 001 010 011
PO - parity odd (P = 0)	100
PE - parity even (P = 1) P - plus (S = 0)	101 110
M - minus (S = 1)	111

JMP addr (Jump)

(PC) <-- (byte 3) (byte 2)

INPUT/OUTPUT INSTRUCTIONS

All Input/Output instructions on the OP-IR are two byte instructions. The first byte is the operation code (either IN or OUT). The second byte is a code number which indicates a function to be performed. Certain devices also require a data byte in the Accumulator which further specifies the function. Many of the functions operate differently depending upon the devices to which they are directed.

Certain I/O function codes operate independently of any device. These codes are as follows:

OPCODE	OPERAND	MNEMONIC	FUNCTION
IN	02	IIN	Reads the OP-1R Interrupt Status Register into the Accumulator.
IN	03	FIXL	Reads the contents of FIXED DATA SWITCH 1 into the Accumulator.
IN	04	FIX2	Reads the contents of FIXED DATA SWITCH 2 into the Accumulator.
OUT	00	INIT	Stop all current devices and clears and initializes all devices.
OUT	01	SEL	Causes all subsequent Device Specific I/O instructions to be directed to the device whose add ress is in the Accumulator when OUT O1 is issued. (Selects a device.) This device will be referred to later as the <u>CURRENT</u>

DEVICE.

OPCODE	OPERAND	MNEMONIC	FUNCTION
OUT	ОСН	SMSK	Sets the current interrupt mask to the value in the Accumulator.
OUT	0 DH	BEEP	Causes the audible (beep) alarm to be sounded.
OUT	0EH	CLICK	Causes an audible click.

Device Specific I/O Instructions should only be issued after a Device has been selected via an OUT Ol instruction.

OPCODE	OPERAND	MNEMONIC	FUNCTION
IN	00	IFL	Reads a byte of status information from the currently selected device into the accumulator.
IN	01	INP	Reads a byte of data from the currently selected device into the accumulator.
OUT	02	OUT	Outputs a byte of data to the currently selected device from the Accumulator.
OUT	03	DVCL	Issues a Device Clear Signal which stops and resets the <u>currently</u> selected device
OUT	04	OFL	Output a byte of Flags or Control information to the currently selected device from the accumulator.
OUT OUT OUT	05 06 07	COM1 COM2 COM3	Are used to output different classes of command bytes to the <u>currently selected device</u> . These instructions are usually interpreted differently depending on the device selected.

Note: The following sections refer to I/O instructions by their mnemonic name. The Ontel assembler recognizes I/O commands only if both opcode (in, out) and operand (i.e. 00H or mnemonic IFL, if IFL is equated to 00H) are specified.

Device Address assignments are listed below.

3R-42. Device Address Assignments

.

SECTION 4R

INTERRUPT CONTROLLER

The interrupt controller processes all interrupt requests issued by the individual devices. The OP-1/R is designed for a maximum of four hardware interrupt requests from the main logic board and four more from an option board. The interrupt priorities and selection of device(s) from which to accept interrupts are program controlled. Figure 4R-1 illustrates the OP-1/R interrupt structure.

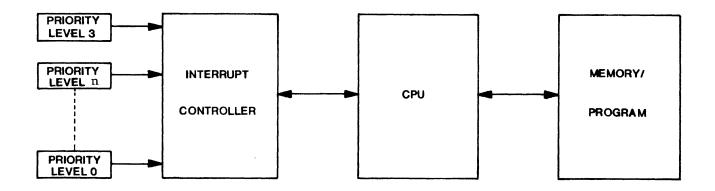

Figure 4R-1. OP-1/R Interrupt Structure

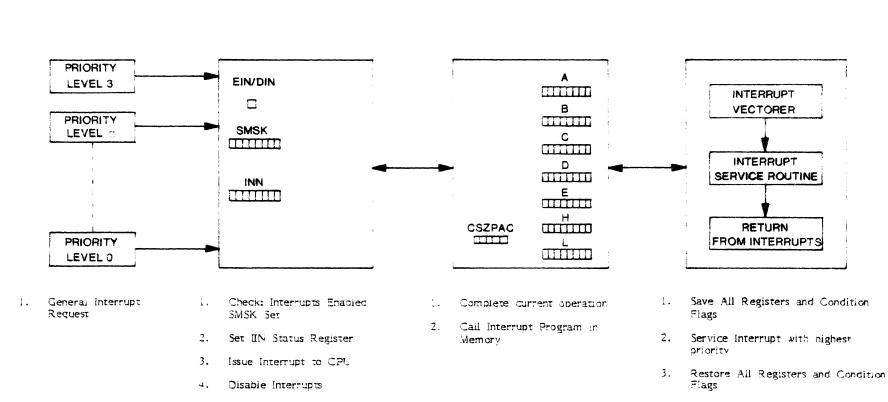

The following conditions have to be met before the interrupt controller will issue an interrupt request to the CPU:

- 1. Interupt request from a device present.
- 2. Interrupts enabled.

1

3. Interrupt mask bit set corresponding to the interrupt request.

After receiving the interrupt request, the CPU will complete its present instruction and then call location 038 (Interrupt Program) in memory using one level of pushdown stack. The existing CPU environment and registers can be saved during interrupt processing in main memory. If two interrupts occur simultaneously, the priorities are serviced in the order determined by the program. The sequence of interrupt operations is illustrated in Figure 4R-2.

CPU

MEMORY/

PROGRAM

Figure 4R-2. Op-1/R Interrupt Sequence of Operations

4R-2

DEVICE

CONTROLLERS

INTERRUPT

CONTROLLER

^{4.} Return to Program in process and Enable Interrupts

Table 4R-1 lists standard OP-1/R interruptt assignments:

PRIORITY LEVEL	FUNCTION
4 (highest)	Alternate I/O Adapter
3	Parallel Input/Output
2	Asynchronous-Receive
1	Asynchronous-Transmit
0	Keyboard/Real Time Clock

Table 4R-1. OP-1/R Interrupt Assignment

COMMANDS

ENABLE INTERRUPTS

Command: EI

Command Byte: None

Enables all interrupts. Interrupt enable is set after the first instruction following EI is executed. It is reset by a DI instruction or by the hardware when any interrupt is processed.

DISABLE INTERRUPTS

Command: DT

Command Byte: None

Disables all interrupts.

SET INTERRUPT MASK

Command: OUT SMSK

Command Byte:

- Bit 4 Alternate I/O Adapter
- Parallel Input/Output Bit 3
- Bit 3 Bit 2 Bit 1 Asynchronous-Receive
- Asynchronous-Transmit
- Bit 0 Keyboard/Real Time Clock

Selects the device(s) from which to accept interrupts by setting the corresponding bit(s) in the SMSK Register to a "1".

INTERRUPT STATUS

Command: IN IIN

Status Byte:

- Bit 4 Alternate I/O Adapter
- Bit 3 Parallel Input/Output
- Bit 2 Asynchronous-Receive
- Bit 1 Asynchronous-Transmit
- Bit 0 Keyboard/Real Time Clock

Loads the contents of the Interrupt Status Register into the accumulator. If the corresponding bit(s) of the SMSK register are set, the Interrupt Status Register bit(s) are set to a "1" when an interrupt request is detected by the CPU. Each bit is reset by the appropriate interrupt Service Routine.

Bits 3-7 will be a "1", if options using these bits are not installed.

STORE/RESTORE CPU STATUS

Prior to servicing an interrupt, the status of the CPU can be saved by transferring the condition flags and register contents to the stack by means of the PUSH instruction.

After the interrupt has been serviced, the CPU status can be restored by means of the POP instruction.

SECTION 5R

FIXED DATA SWITCHES

Two eight-bit fixed data switches have been provided for general programming purposes. The switches can be manually set at the time of installation to specify the particular OP-1/R identifying address or any other general function such as mode selection.

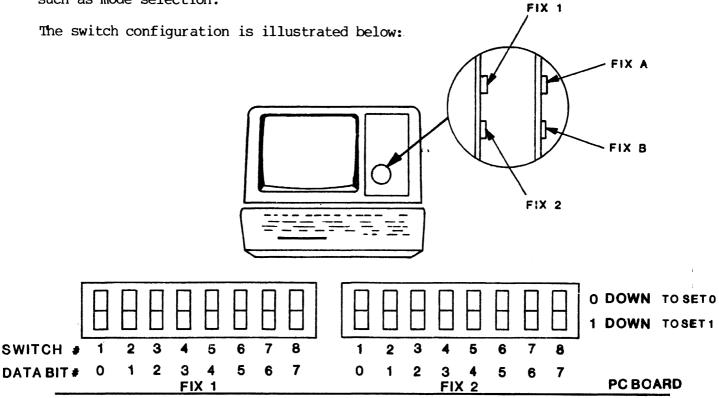

Figure 5R-1. Fixed Data Switches

COMMANDS

The following commands can be executed:

INPUT DATA

Command: IN FIX1

Transfers the contents of the FIX1 switch to the Accumulator. The content of switch Bit n is loaded into Accumulator Bit n-1.

Command: IN FIX2

Transfers the contents of the FIX2 switch to the Accumulator. The content of switch Bit n is loaded into Accumulator Bit n-1.

SECTION 6R

KEYBOARD AND REAL TIME CLOCK

The movable keyboard provides an interface between the operator and the OP-1/R. Every key generates a unique code readable by the CPU. The keyboard is arranged in four functional sections:

- 1. ASCII Section
- 2. Control Pad
- 3. Numeric Pad
- 4. Function Pad

Figure 6R-1 illustrates the Keyboard arrangement.

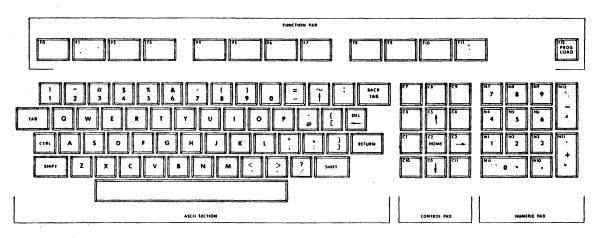

Figure 6R-1. Keyboard Arrangement

The ASCII Section contains the entire upper and lower case alphabet, the number set and standard operator controls such as Shift, Tab and Return. the Control Pad houses 12 control keys including cursor controls. Numerals 0-9, period, plus and minus on the 13-key Numeric Pad are arranged in a calculator format. The Function Pad consists of 12 multi-purpose functions keys, four of which may contain an integral status light and a Program Load (PROG) key.

The keyboard design includes an audible alarm and an automatic repeat feature: every key held down for more than one second will repeat its code at 15 times/second. The CPU can be interrupted with every key depression. Every key generates up to four unique codes, e.g., the numerals in the ASCII Section generate different codes than the corresponding keys on the Numeric Pad. The codes generated are listed in Tables 6R-1 through 6R-4.

COMMANDS

Commands to the keyboard may be executed if it has been selected by the CPU as the active I/O device.

SELECT

Command: OUT SEL

Command Byte: El

Selects the keyboard for I/O operation.

STOP

Command: OUT DVCL

Command Byte: None

Clears any character that may have been entered on the keyboard. Resets the interrupt request, Keyboard Character Available flag, Real Time Clock and Timeout Flag.

STATUS

Command: IN IFL

Command Byte:

Bit 7 Keyboard Character Available Bit 6 Real Time Clock Timeout

Loads the accumulator with keyboard operational status.

INPUT

Command: IN INP

Reads the eight-bit code from the keyboard into the accumulator. Resets the Keyboard Character Available flag and the Keyboard interrupt request.

SET STATUS LIGHTS

Command: OUT OFL

Command Byte:

Bit	3	Turn	F3	Light	On
Bit	2	Turn	F2	Light	On
Bit	1	Turn	Fl	Light	On
Bit	0	Turn	F0	Light	On

Turns on status lights housed in keys F0, F1, F2, F3 located on the Function Pad.

AUDIBLE TONES

Command: OUT BEEP

Command Byte: None

Activates a one second audible tone. The keyboard does not have to be selected to execute a BEEP instruction.

Command: OUT CLICK

Command Byte: None

Activates an audible click. The keyboard does not have to be selected to execute.

REAL TIME CLOCK

Command: OUT COM1

Command Byte: None

Starts a 1 second \pm 10% timer. At the end of the timing interval, Status Bit 6 and an Interrupt Request 0 will be set. The keyboard must be selected to execute this command.

Executing another COM1 during the timing interval will reset the timer and initiate a new 1 second timing interval.

Command: OUT COM2

Command Byte: None

Cancels the timing interval by clearing the timer. Status Bit 6 and its Interrupt Request will be reset if set. The keyboard must be selected to execute this command.

INTERRUPT CONTROL

Priority Level No. 0 (lowest priority) Set when a keyboard character is available. Reset by the INP or DVCL command. Identical to IFL status bit 7. Also set when the Real Time Clock times out. Identical to IFL status bit 6. Reset by COM1, COM2 or DVCL.

PROGRAM LOAD KEY (PROG)

Depressing the PROG key in conjunction with the SHIFT and CTRL key causes the CPU to execute the instruction stored in location 8000.

(1) Causes the CPU to execute the instruction stored in memory location 8000.

SECTION 7R

ASYNCHRONOUS I/O ADAPTER

The Asynchronous I/O Adapter connects the CPU I/O bus to an external communications modem. Operation is performed in full duplex in a serial start-stop format. The adapter is designed to operate at 50 to 19200 bits-per-second using an EIA RS232C interface or 2 wire direct interface. A 20 ma current loop interface option is limited to 9600 bits per second. All communications functions are program controlled. The CPU can be interrupted by the adapter after completion of every character received or transmitted.

COMMANDS

Commands to the Asynchronous I/O Adapter may be executed if it has been selected by the CPU as the active I/O device. The adapter will remain selected until a different I/O device selection is made.

SELECT

Command: SEL

Command Byte: F0

Selects the Asynchronous Adapter for I/O operations.

STOP

Command: DVCL

Command Byte: None

Resets the Asynchronous I/O Adapter and aborts any current activity. DVCL should be used prior to issuing any operational command when the status of the Asynchronous Adapter is uncertain. The DVCL command will reset the Character Received and Available flag, the Parity, Overrun or Framing Error flag and the output control signals to the modem (Bits 7 and 5 of IFL and OFL Bits 3, 2, 1 and 0). DVCL also sets the Character Needed for Transmission flag (IFL bit 6).

STATUS

Command: IFL

Status Byte:

Bit 7	Character Received and Available
Bit 6	Character Needed for Transmission
Bit 5	Parity, Overrun or Framing Error. This bit remains High
	until the next character is received.
Bit 4	Clear to Send signal is On
Bit 3	
Bit 2	Carrier Detect signal is On
Bit l	Data Set Ready signal is On
Bit O	

Loads the accumulator with an operational status byte from the Asynchronous I/O Adapter. Bits 0 to 4 follow the modem signals.

OUTPUT

Command: OUT

Transfers a data byte from the accumulator to the Asynchronous I/O Adapter for transmission. It should be issued only after the adapter has indicated that a character is needed for transmission. The Character Needed for Transmission flag will be reset until the character is transmitted and a new character is required.

INPUT

Command: INP

Transfers a received data byte from the Asynchronous I/O Adapter to the accumulator. It should be issued only after the adapter has indicated that a received character is available. INP resets the Character Received and Available flag.

SET MODEM

Command: OFL

Command Byte:

DIC J DICUM ILUMNIECCCO DUCU	Bit	3	Break	Transmitted	Data
------------------------------	-----	---	-------	-------------	------

- Bit 2 Bit 1 Data Terminal Ready
- Bit 0 Hold Request to Send signal On

SET COMMUNICATIONS PARAMETERS

Command: COM1

Command Byte:

Bit 7 Two Stop Bits (vs. one) Bit 6 Eight Data Bits (vs. seven) Bit 5 No Parity Bit 4 Even Parity (vs. odd) Bit 3 Bit 2 Bit 1 Bit 0 Bit 3

BAUD RATE 134.5

Establishes communications parameters by transferring a command byte from the accumulator to the Asynchronous I/O Adapter. The parameters will remain set until changed by a subsequent COM1.

INTERRUPT CONTROL

The Asynchronous I/O Adapter provides two interrupt request signals to the CPU:

Priority Level No. 2 (No. 3 is highest) A character is received and available. Identical to IFL status bit 7.

<u>Priority Level No. 1</u> A Character is needed for transmission. Identical to IFL status bit 6.

PIN	CKT	DESCRIPTION

Connector: Cannon DBC-25S

Table 7R-1-3 Asynchronous I/O Adapter Pin Assignments 2 Wire Direct Signals

This is a half duplex interface utilizing two wires: a data line that switches from -12V (mark) to ground (space) and a ground line.

NOTE: RTS turns off received data.

Figure 7R-1. External Connector to Asynchronous I/O Adapter

Figure 7R-1 illustrates the Asynchronous I/O Adapter connector location.

SECTION 8R

PARALLEL OUTPUT PRINTER ADAPTER/PARALLEL INPUT ADAPTER

The Parallel I/O Adapter can be configured as either a Parallel Output Printer Adapter or a Parallel Input Adapter.

PARALLEL OUTPUT/ADAPTER

The Printer Adapter interfaces the CPU I/O bus to a parallel interface printer. All printer functions are program controlled. The CPU can be interrupted by the printer adapter whenever it is ready to receive a character.

COMMANDS

Commands to the Adapter may be executed only if the adapter has been selected by the CPU as the active I/O device. The adapter will remain selected until a different I/O device selection is made.

SELECT

Command: SEL Command Byte: 1B

Selects the Adapter for I/O operation.

PRINT

Command: OUT

Transfers a character from the accumulator to the printer via the Adapter. The OUT command also resets the interrupt request and the character request status bit.

STOP

Command: DVCL Command Byte: None

Resets the adapter and aborts any current activity. This command should be used prior to issuing a print command when the status of the controller is uncertain, such as the start of a program.

STATUS

Command: Status By	IFL vte:	
Bit 7	NOT BUSY	Set when the Adapter is ready to receive a new print or control character.
Bit 6	PRINTER SELECTED	Set when the printer has been selected either locally or by CPU command.
Bit l	PRINTER NOT READY	Set when the printer is not ready to receive data, i.e. it is not connected or is out of paper, etc.
Bit O	PRINTER BUSY	Set when the printer is executing a print operation or when the printer is ready but not selected.

Loads the accumulator with an operational status byte from the printer adapter.

INTERRUPT CONTROL

The Printer Adapter provides an interrupt request whenever it is ready to receive a print or control character. The priority level shall be level 3.

PIN	DESCRIPTION
1	Protective Ground
2	Printer Acknowledge
3	Data Strobe
4	Printer Selected Signal

Table 8R-1-1 Printer Adapter Pin Assignments

This is a parallel output interface using TTL compatible signals. Each byte is output together with a 1.5 usec strobe and must be acknowledged before the next byte.

PARALLEL INPUT ADAPTER

The Parallel Input Adapter interfaces the CPU I/O bus to a general purpose parallel input interface. The CPU can be interrupted when input data has been loaded into the adapter.

COMMANDS

Commands to the Parallel Input Adapter may be executed only if the adapter has been selected by the CPU as an active I/O device. The adapter will remain selected until a different I/O device selection is made.

SELECT

Command: SEL Command Byte: OF

Selects the Parallel Input Adapter for I/O operation.

STOP

Command: DVCL Command Byte: None

Resets the adapter and aborts any current activity. This command should be used prior to issuing a parallel input command when the status of the controller is uncertain, such as the start of a program. This command should be followed by an INP command to reset the interrupt request.

INPUT

Command: INP Command Byte: Data - 8 Bits

Transfers a character from the Parallel Input Adapter to the accumulator. The INP Command also resets the interrupt request and data available flag.

STATUS

Command: IFL Status Byte:

Bit 7Data AvailableSet when data is loaded into the
Paralel Input Adapter.Bit 6: General Purpose input status bits for Programmer's use.Bit 1: General Purpose input status bits for Programmer's use.Bit 0: General Purpose input status bits for Programmer's use.Loads the accumulator with an operational status byte from the parallel input adapter.

INTERRUPT CONTROL

The parallel Input Adaptor provides an interrupt request whenever it has received a data byte. The interrupt request is reset when the CPU reads the data. Priority level is 3.

SECTION 9R

DISPLAY MICROPROCESSOR AND CRT

The CRT display unit consists of a Display Microprocessor, video generator and a 14-inch diagonal equipped with a non-glare CRT faceplate. All display functions are program controlled.

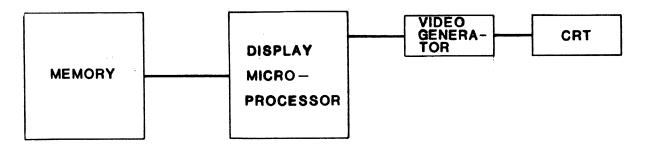

Figure 9R-1. Display Microprocessor and CRT

The Display Microprocessor interfaces the memory to the CRT display. For display purposes, the memory is converted into a continuous 80 character wide display page. Data are transferred from the memory to the video generator to refresh the screen. Access to the memory is obtained during each character line display to obtain the 80 characters to be displayed on the next line.

The total memory can be assigned as a display page. The display screen is a movable window in the display page as illustrated below:

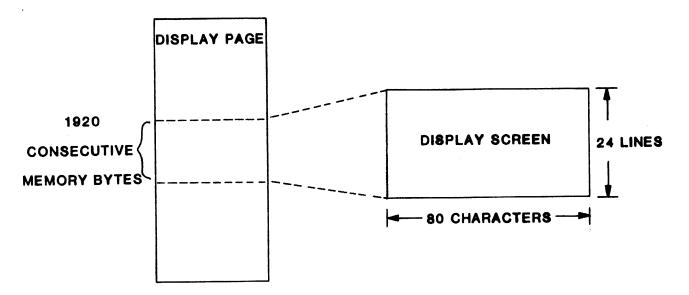

Figure 9R-2. Display Window

The video generator codes are illustrated in Table 8R-1. Tagged Characters (codes from 80 to FF) can be displayed with special emphasis as described in Display Status Commands.

Table 9R-1-1 Video Generator Codes

DISPLAY COMMANDS

Display commands are passed to the Display Microprocessor via memory locations 0800 to 0806 as follows:

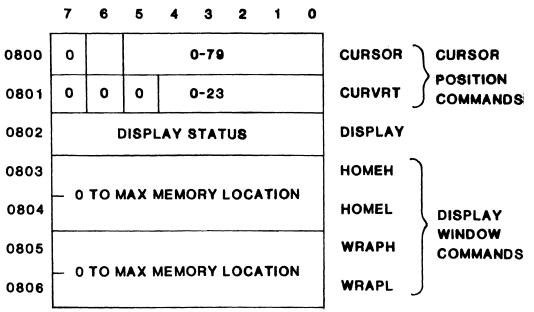

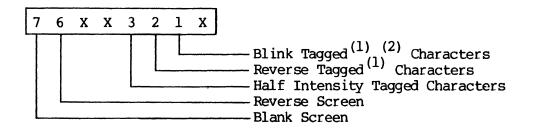

Table 9R-1-2 Display Commands

CURSOR POSITION COMMANDS

CURHOR - LOCATION 0800	Cursor Horizontal Position (0-79)
CURVRT - LOCATION 0801	Cursor Vertical Position (0-23)

DISPLAY STATUS COMMANDS

DISPLY - LOCATION 0802 Display Status in the following format:

(1) Characters from Table 9R-1 with codes from 80 to FF are defined as Tagged Characters.

(2) Simultaneous Blink and Half intensity tagged characters will be displayed Half intensity only.

DISPLAY WINDOW COMMANDS

HOMEH - LOCATION 0803	Home Position address (High)
HOMEL - LOCATION 0804	Home Position address (Low)
WRAPH - LOCATION 0805	Wrap Position address (High)
WRAPL - LOCATION 0806	Wrap Position address (Low)

The display memory is illustrated in Figure 9R-3. Note that the size of the page is variable by changing the WRAP command. The last character in the display buffer should be the last physical location in memory in order to enable wraparound capabilities. The display window may be moved by changing the HOME command.

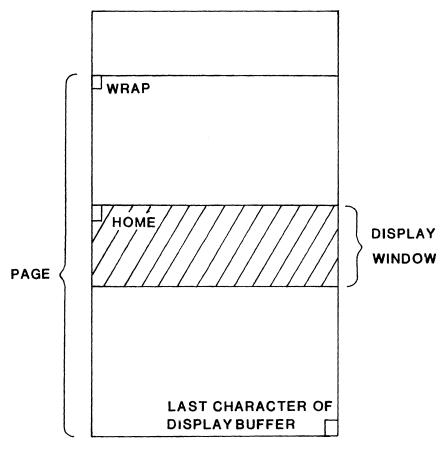

Figure 9R-3. Display Memory

If the HOME position is less than 24 lines above the end of the display buffer, the Display Mircroprocessor automatically wraps around to the location specified by the WRAP command as illustrated in Figure 8R-4. The HOME position must be a whole number of lines above the end of the display buffer so that the last character buffer is at the end of a line.

The display microprocessor refreshes memory as it accesses data for the T.V. screen. The 16K RAM used on the OP-1/R requires 128 consecutive accesses; two consecutive character rows must be read to refresh memory. Therefore, the WRAP address must be limited so address (XXXX XXXX XX00 0000) to (XXXX XXXX XX10 1111) are accessed on the first row after the screen wraps.

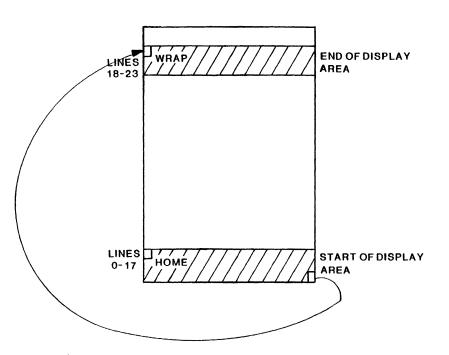

Figure 9R-4. Display Window with Wraparound

DISPLAY BLANKING

The display may be blanked line-by-line by selectively storing an end of line character in the body of the display data. Two characters are implemented:

LEOL - Logical End of Line	Unconditionally blanks all characters
Character - Code 8F	appearing after it until the end of the display line.
FLEOL - Forms Logical End	Blanks untagged characters appearing
of Line Character - Code 9F	after it until the first LEOL or end of the display line, whichever appears first.

TIMING

Transfers are made by the Display Microprocessor to the video generator on a cycle steal basis transparent to the CPU operation. The timing periods are:

- 1. Synchronization wait: The Display Microprocessor requests access to the memory once during each character line display to obtain the 80 characters to be displayed on the next character line. The CPU is allowed to complete the current cycle before access is granted. The synchronization delay requires 0 2 usec.
- 2. Transfer of the 80 characters of a line: 55 usec.
- 3. Transfer of display commands: 15 usec.

Blink Characters

Half Intensity Characters

4. The display screen is refreshed every 16,666 usec. The following calculation determines the ratio of time the CPU can use the memory to the total available time.

 $\frac{16,666 \text{ usec} - (26 \times 55 + 15)}{16,666} = .913 (50 \text{ or } 60 \text{ Hz})$

SUMMARY OF DISPLAY SPECIFICATIONS

9R-6

SECTION 10R

ALTERNATE I/O ADAPTER

The Alternate I/O Adapter interfaces the CPU I/O bus to a secondary external device such as a printer or second communication line. All I/O functions are under program control. The CPU can be interrupted by the Alternate I/O Adapter after completion of a transfer of every character.

The following configurations are available. They determine which device attaches to the terminal.

- . A bit serial Asynchronous Adapter with RS232 interface
- . A bit serial Asynchronous Adapter with 20ma current loop interface
- . A bit serial Asynchronous Adapter with 2 wire direct interface
- . A printer adapter with parallel interface

In addition, the alternate I/O adaptor may be equipped with two eight bit data switches that are similar in function to the Fixed Data switches described in Section 5R.

ALTERNATE ASYNCHRONOUS I/O ADAPTER

The Alternate Asynchronous I/O Adapter connects the CPU I/O bus to an external communications modem. Operation is performed in full duplex in a bit serial start-stop format. The adapter is designed to operate at 50 to 19,200 bits-per-second. All communication functions are program controlled.

Three interfaces are available for use with the adapter (Factory installation only) as follows:

- 1. EIA RS 232 C
- 2. 20ma current loop
- 3. 2-wire direct

For 20ma current loop interface the baud rate is limited to 9600 bits per second.

The CPU can be interrupted by the adapter after completion of every character received or transmitted if the adapter is not in Ring Mode. In Ring Mode only the Ring Detector signal can interrupt the CPU.

COMMANDS

Commands to the Alternate Asynchronous I/O Adapter may be executed if it has been selected by the CPU as the active I/O device. The adapter will remain selected until a different I/O device selection is made.

SELECT

Command: SEL

Command Byte: 2B

Selects the Alternate Asynchronous Adapter for I/O operations.

STOP

Command: DVCL

Command Byte: NONE

Resets the Alternate Asynchronous I/O Adapter and aborts any current activity. DVCL should be used prior to issuing any operational command when the status of the Alternate Asynchronous Adapter is uncertain. The DVCL command will reset the Character Received and Available flag, the Parity, Overrun or Framing Error flag, the output control signals to the modem, the Input Data Mode, Ring Mode and the Low Data Bit Mode. The DVCL command also sets the Character Needed for Transmission flag.

STATUS

Command: IFL

Status Byte:

Bit 7	Character Received and Available.						
Bit 6	Character Needed for Transmission.						
Bit 5	Parity, Overrun or Framing Error. This bit remains high						
	until the next character is received.						
Bit 4	Clear to Send signal is on.						
Bit 3	Supervisory Received Data signal is on.						
Bit 2	Carrier Detector signal is on.						
Bit 1	Data Set Ready signal is on.						
- '' A	Dina Debenhan airrel in an						

Bit 0 Ring Detector signal is on.

Loads the accumulator with an operational status byte from the Alternate Asynchronous I/O Adapter, provided that the Input Status Mode was previously selected by the COM2 instruction.

OUTPUT

Command: OUT

Transfers a data byte from the accumulator to the Alternate Asynchronous I/O Adapter for transmission. It should be issued only after the adapter has indicated that a character is needed for transmission. The Character Needed for Transmission status bit will be reset until the character is transmitted and a new character is required.

INPUT

Command: IFL

Transfers a received data byte from the Asynchronous I/O Adapter to the accumulator, provided that the Input Data Mode was previously set by the COM2 instruction. It should be issued only after the adapter has indicated that a received character is available. The Input Command resets the Character Received and Available Flag.

SET MODEM

Command: OFL

Command Byte:

- Bit 3 Break Transmitted Data.
- Bit 2 Hold Supervisory Transmit Data signal on.
- Bit 1 Hold Data Terminal Ready signal on.
- Bit 0 Hold Request to Send signal on.

SET COMMUNICATIONS PARAMETERS

Command: COM1

Command Byte:

Bit 7 Two Stop Bits (vs one). Bit 6 Eight Data Bits (vs. 7) or 6 Data Bits (vs. 5) (See COM3). Bit 5 No Parity. Bit 4 Even Parity (vs. Odd). Bit 3 Bit 2 Baud rate selection for both transmit and receive in the following format: Bit 0

	BI	[T]		BAUD RATE
3	2	1	0	
0 0 0 0 0 0 0 0 0 1 1 1 1	0 0 0 0 1 1 1 0 0 0 0 0	0 0 1 1 0 0 1 1 0 0 1 1 0 0 1	0 1 1 0 1 1 0 1 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1	50 75 110 134.5 150 300 600 1200 1800 2000 2400 3600
1 1 1 1 1 1	1 1 1 1	0 0 1 1	0 1 0 1	4800 7200 9600 19200

Establish communications parameters by transferring a command byte from the accumulator to the Asynchronous I/O Adapter. The baud rate for both transmit and receive are set equal by this command. A subsequent COM3 command may change the baud rates for the receive only so as to have different baud rates for transmit and receive. The program should ignore the most significant bits of the data which are not used when 5, 6 or 7 data bits modes are used.

SET INPUT MODE

Command:	COM2	
Command Byte:	Bit $0 = 1$	SET INPUT DATA MODE
	Bit $0 = 0$	SET INPUT STATUS MODE

Conditions the adapter to interpret the next IFL command. DVCL will set Input Status Mode.

AUXILIARY COMMAND

Command: COM3 Command Byte: See Below Bit 7 Low Data Bit Mode Bit 6 Ring Detect Mode Bit 5 Enable Transmit Interrupt Bit 4 Bit 3 Receive baud rate selection as per Bit 2 table under COM1 description Bit 1 Bit 0

Bit 7 sets the bits per character to 6 or 5 as opposed to 8 or 7.

Bit 6 sets the Ring Detect Mode which locks out the interrupts from the character received and character needed flags and instead allows the interrupt to be set by the Ring Detector Signal. The Data Terminal Ready signal should be off in this mode so that the Ring Detector Signal will continue until it is detected by the Status Command (IFL).

Bit 5 allows character needed for transmission signal (IFL Bit 6) to generate an interrupt to the CPU.

Bits 0 thru 3 set the receive data baud rate independent of the transmit baud rate. The COM1 commands set the baud rate for both transmit and receive.

The Low Data bit and Ring Modes are both reset by the DVCL command. Resetting the Ring Mode also resets the Interrupt caused by the Ring Detector Signal.

- NOTE: The hardware does not allow bit 7 and bits 0-3 to be chosen with the same COM3 command. In order to choose both the low data bit mode and a different Transmit baud rate from Receive rate, the software must be in the following sequence.
 - 1) A COM3 choosing Bit 7 high for 6 (5) data bits family.
 - 2) A COM1 choosing either 6 or 5, and setting the Transmit/Receive combined baud rate.
 - 3) A COM3 choosing the Receive baud rate (and continuing to hold bit 7 high).

INTERRUPT CONTROL

The Alternate Asynchronous I/O Adapter provides a single interrupt request whenever a character is received and available or when a character is needed for transmission or a ring signal is received when the adapter is in Ring Detect Mode. The Status command must be used to interrogate status bits 6, 7 and 0 to determine the source of the interrupt. The priority level is 4.

PRINTER ADAPTER

The Printer Adapter interfaces the CPU I/O bus to a parallel interface printer. All printer functions are program controlled. The CPU can be interrupted by the printer adapter whenever it is ready to receive a character. For detailed interface information see Table \Re -1.

COMMANDS

Commands to the Printer Adapter may be executed only if the adapter has been selected by the CPU as the active I/O device. The adapter will remain selected until a different I/O device selection is made.

SELECT

Command: SEL Command Byte: 2B

Selects the print controller for I/O operation.

PRINT

Command: OUT

Transfer a character from the accumulator to the printer via the Printer Adapter. The OUT command also resets the interrupt request and the character request status bit.

STOP

Command: DVCL Command Byte: None

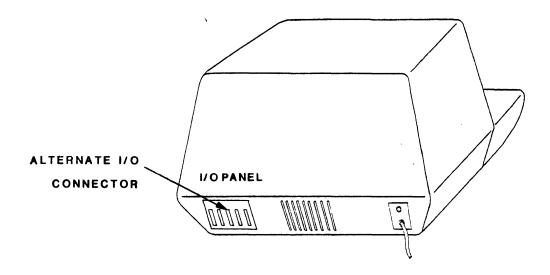

Resets the adapter and aborts any current activity. This command should be used prior to issuing a print command when the status of the controller is uncertain, such as at the start of a program. STATUS

Command: IFL Status Byte:		
Bit 7	NOT BUSY	Set when the Printer Adapter is ready to receive a new print or control character.
Bit 6	PRINTER SELECTED	Set when the printer has been selected either locally or by CPU command.
Bit 1	PRINTER NOT READY	Set when the printer is not ready to receive data, i.e. it is not connected or is out of paper, etc.
BIT O	PRINTER BUSY	Set when the printer is exe- cuting a print operation or when the printer is ready but not selected.

Loads the accumulator with an operational status byte from the printer adapter.

INTERRUPT CONTROL

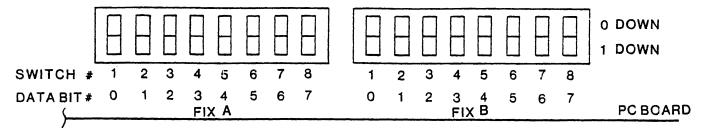

The Printer Adapter provides an interrupt request whenever it is ready to receive a print or control character. The priority level is 4.

FIXED DATA SWITCHES

Two eight-bit Fixed Data Switches can be provided for general programming purposes. The switches can be manually set at the time of installation to specify an identifying address or any other general function such as mode selection.

The switch configuration is illustrated below: (see figure 5R-1 for location)

COMMANDS

Commands to the Fixed Data Switches may be executed if it has been selected by the CPU as the active I/O device. The switches will remain selected until a different I/O device selection is made.

SELECT

Command:	SEL
Command Byte:	lD

Selects the data switches for subsequent input to the CPU by an IFL instruction.

SWITCH SELECT A

Command	:	COM1
Command	Byte:	None

Selects switch A for subsequent data transfer with the IFL command.

SWITCH SELECT B

Command: COM2 Command Byte: None

Selects switch B for subsequent data transfer with the IFL command.

INPUT DATA

Command: IFL

Transfers the contents of Switch A or Switch B to the accumulator, depending on whether it was preceded by a COM1 or a COM2. The contents of switch bit n is loaded into accumulator bit n.

SECTION 11R

OP-1/RW

WORD PROCESSING DISPLAY MICROPROCESSOR AND CRT

The CRT display unit consists of a Display Microprocessor, video generator and a 14-inch diagonal, non-glare CRT. All display functions are program-controlled. The Display Microprocessor features a high resolution display with a 7 x 12 dot matrix. A character set of 128 characters is available, user definable at manufacturing time.

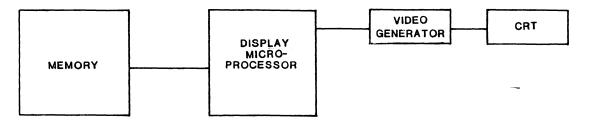

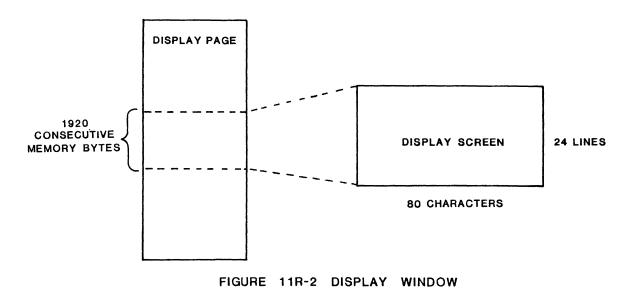

FIGURE 11R-1 DISPLAY MICROPROCESSOR AND CRT

The Display Microprocessor interfaces memory to the CRT display. For display purposes, the memory is converted into a continuous 80 or 160 character wide display page. Data is transferred from the memory to the video generator to refresh the screen. Access to the memory is obtained during each character line display to obtain the 80 characters to be displayed on the next line.

The total memory can be assigned as a display page. The display screen is a moveable window in the display page as illustrated below:

11**R-1**

CHARACTER GENERATOR

The display Microprocessor character fonts are stored in ROM and can be user defined at time of manufacture. A distinct, user definable character will be generated for each data code from 00 to 7F. This character set will repeat for codes 80 to FF. However, for these codes the characters are considered tagged and can be presented as normal characters, or with special emphasis according to the DISPLY1 command.

Any character can be included in a family of Suppressable Characters at time of manufacture. Suppressable Characters can be displayed as spaces via the DISPLY1 command.

CURSOR DISPLAY

The cursor is displayed as a Blinking reversed block at the horizontal and vertical location specified by CURHOR and CURVRT.

OPERATING MODES

The Display Microprocessor always operates in the Visual Enhancement mode which provides three different enhancement capabilities needed in text editing applications. Enhancements are provided on a text string by means of start and end delimiter characters where all characters between a pair of delimiters are highlighted. Two sub-modes are available:

a) 80 column text page

Allows the screen to be scrolled up and down through the full memory and the wrap at the end of memory to be utilized fully.

b) 160 column text page

Allows the 80 column display window to be scrolled horizontally across the 160 column text page. The use of the wrap at the end of the memory is limited. If the display page is allowed to wrap at the end of memory, all enhancement start characters prior to the end of memory must be kept within an 80 column display window or an unpredictable display of enhancement will result as the window is horizontally moved across the area.

DISPLAY COMMANDS

Display commands are passed to the Display Microprocessor via memory locations 0800 to 0806 as follows:

LOCATION	7	6	5	4	3	2	1	0	NAME
0800	0				0-79	I			CURHOR
0801	*	0	0		0-23				CURVRT
0802		0		0		0		0	DISPLY1
0803						.			HOMEH
0804			A. MAR						HOMEL
0805			<u> </u>						WRAPH
0806									WRAPL

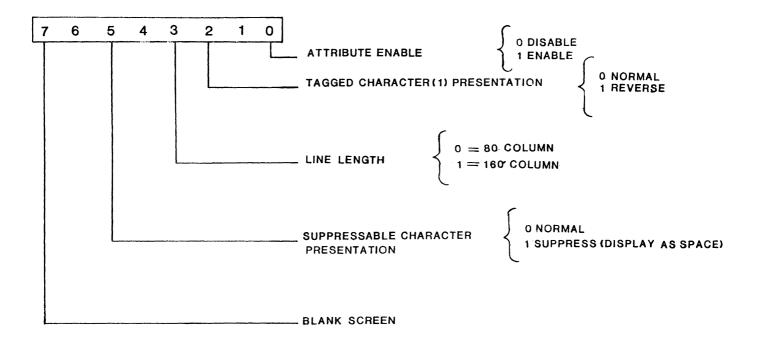

FIGURE 11R-3 DISPLAY COMMAND

CURSOR POSITION COMMANDS

CURHOR - LOCATION 0800	Cursor Horizontal Position (0-79)
CURVRT - LOCATION 0801	Cursor Vertical Position (0-23)
*Bit 7=0	Start enhancement from HOME position
Bit 7=1	Start enhancement from WRAP location

DISPLAY STATUS COMMANDS

DISPLY1 - LOCATION 0802

(1) CHARACTERS WITH CODES FROM 80 TO FF ARE DEFINED AS TAGGED CHARACTERS.

DISPLAY WINDOW COMMANDS

- HOMEH LOCATION 0803
- HOMEL LOCATION 0804
- WRAPH LOCATION 0805
- WRAPL LOCATION 0806

Home Position Address (High) Home Position Address (Low) Wrap Position Address (High) Wrap Position Address (Low)

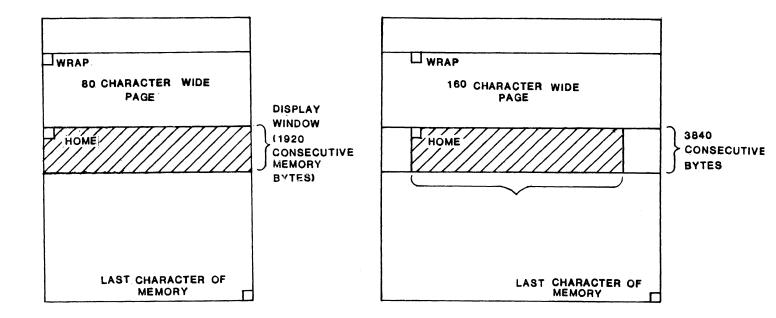

FIGURE 11R-4 DISPLAY MEMORY

The HOMEH and HOMEL bytes are concatenated to define the address of the first character visible in the display window. A line scrolling effect is created by changing this address by whole line increments (80 or 160). Horizontal scrolling, in the 160 wide mode, is effected by changing the address by single increments.

If the HOME position is less than 24 lines above the end of the memory, the Display Microprocessor automatically wraps around to the location specified by the WRAP command as illustrated in Figure 11R-5. The HOME position must be a whole number of lines above the end of the display buffer so that the last character in the display buffer is at the end of a line.

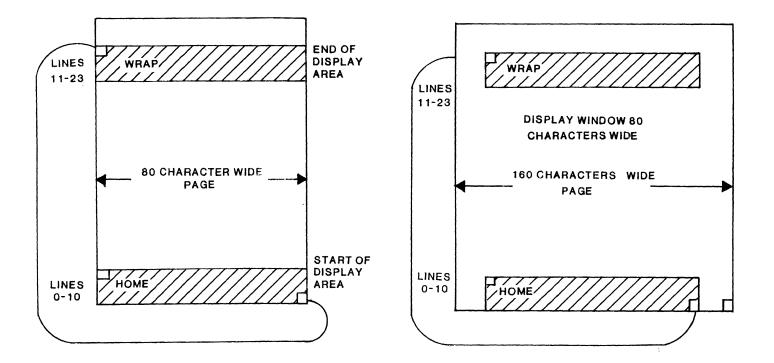

FIGURE 11R-5 DISPLAY WINDOW WITH WRAPAROUND

The display microprocessor refreshes memory as it accesses data for the T.V. screen. The 16K RAM used on the OP-1/R requires 128 consecutive accesses; two consecutive character rows must be read to refresh memory. Therefore, the WRAP address must be limited so address (XXXX XXXX XX00 0000) to (XXXX XXXX XX10 1111) are accessed on the first row after the screen wraps.

VISUAL ENHANCEMENT SPECIFICATION

At time of manufacture the various suppressible and enhancement character codes must be specified.

Three attributes are available.

A. Underline

Underlines a group of characters that are delimited between the starting code and stop code.

B. Bright

Normal intensity a group of characters that are delimited between the starting code and stop code.

(NOTE: Standard display is half-intensity)

C. Blink

Blinks a group of characters that are delimited between the starting code and stop code.

NOTES:

- 1. Any code may be factory assigned as an enhancement delimiter or a suppressable character. All enhancement delimiters are automatically suppressible. More than one character can be assigned to a particular enhancement delimiter.
- 2. The Display Microprocessor is capable of providing the enhancement even if the starting code of a particular enhancement pair is not visable on the screen. Since the display is a "window" in the memory, this capability is limited to the occurrence of at least one ending delimiter of every group within the display window.
- 3. Provision is made to allow for using the display window wraparound as continuous or non-continuous text in association with the display enhancement. At the programmer's option (by setting bit 7 of the CURVRT command to 1) the enhancement capability as described above in 2 will take place beginning at the WRAP location.

TIMING

Transfers are made by the Display Microprocessor to the video generator on a cycle steal basis transparent to the CPU operation.

The timing periods are:

- 1. Synchronization wait: The Display Microprocessor requests access to the memory once during each character line display to obtain the 80 characters to be displayed on the next character line. The CPU is allowed to complete the current cycle before access is granted.
- 2. For 80 column operation one block of 80 characters is transferred for each character line.
 - a) Transfer time 55 usec, 8.3% of CPU time
- 3. For 160 column operation two blocks of 80 characters are transferred for each character line.
 - a) Transfer time 110 usec, 16.6% of CPU time

SUMMARY OF SPECIFICATIONS

Screen Size:	14-inch diagonal
Screen Capacity:	1920 characters
Display Format:	24 lines of 80 characters
Character Size:	0.21 x 0.09 inch
Character Generation:	Dot Matrix: 7 x 9 (upper case)
	7 x ll (lower case)
Cursor:	Blinking Reversed Block
TV Raster:	312 lines, non-interlaced
Refresh Rate:	50 or 60 times per second
	-
Displayable Character Set:	One set of 128 characters

ENHANCEMENT PROM CODING

The enhancement PROM is a 256 x 4 PROM located at A48. The hex code of the selected character is used as the PROM address.

FUNCTION	PROM ADDRESS	PROM CODE (In Hex)
START BOLD	XX	Е
STOP BOLD	XX	6
START UNDERLINE	XX	D
STOP UNDERLINE	XX	5
START BLINK	XX	В
STOP BLINK	XX	3
STOP ALL	XX	0
SUPPRESS	XX	7
ALL OTHER ADDRESSES		F

CHARACTER FONT PREPARATION

A program has been designed which allows user defined character fonts to be created and modified. Refer to the Miscellaneous 8080 Programmer's Manual for directions.

The diskette containing the character description should be sent to ONTEL CORPORATION to be burned-in a 2716 PROM.

SECTION 12R

SYNCHRONOUS I/O ADAPTER

The Synchronous I/O Adapter connects the CPU I/O bus to an external communications modem. Operation is performed in full duplex in a serial synchronous format. The adapter is designed to operate at up to 50,000 bits-per-second using an EIA RS232C interface. All communications functions are program controlled. The CPU can be interrupted by the adapter after completion of every character received or transmitted.

COMMANDS

Commands to the Synchronous I/O Adapter may be executed if it has been selected by the CPU as the active I/O device. The adapter will remain selected until a different I/O device selection is made.

SELECT

Command: SEL

Command Byte: F0

Selects the Synchronous I/O Adapter for I/O operations.

STOP

Command: DVCL

Command Byte: None

Resets the Synchronous I/O Adapter and aborts any current activity. DVCL should be used prior to issuing any operational command when the status of the Synchronous Adapter is uncertain. The DVCL command will reset the Character Received and Available flag, the Parity, or Overrun Error flag and the Output control signals to the modem (Bits 7 and 5 of IFL and OFL Bits 3, 1 and 0). DVCL also sets the Character Needed for Transmission flag (IFL bit 6).

STATUS

Command: IFL

Status Byte:

- Bit 7 Character Received and Available Bit 6 Character Needed for Transmission Bit 5 Parity, or Overrun Error. This bit remains High until the next character is received.
- Bit 4 Clear to Send signal is On
- Bit 3 Not Used
- Bit 2 Carrier Detect signal is On
- Bit 1 Data Set Ready signal is On
- Bit 0 Not Used

Loads the accumulator with an operational status byte from the Synchronous I/O Adapter. Bits 1 and 2 follow the modem signals.

INPUT

Command: INP

Transfers a received data byte from the Synchronous I/O Adapter to the accumulator. It should be issued only after the adapter has indicated that a received character is available. INP resets the Character Received and Available flag.

SET MODEM

Command: OFL

Command Byte:

- Bit 3 Break Transmitted Data
- Bit 2 Not Used
- Bit 1 Data Terminal Ready
- Bit 0 Hold Request to Send signal On

SELECT REGISTER

Command:	COM1
----------	------

Command Byte:

1.	HEX 80	Select Transmit Synch Register
2.	HEX 40	Select Control Register
3.	HEX 20	Select Receive Synch Register
4.	HEX 10	Select Transmit Data Register

OUTPUT

Command: OUT

Transfers a byte from the accumulator to the register in the Synchronous I/O Adapter that has been selected by a COM1 instruction.

- 1. Transmit Synch Register Contains the Synchronizing or Idle Character for transmission.
- 2. Control Register Defines communication parameters as follows:

Bit 7	1	=	Even Parity
	0	=	Odd Parity

Bit 6	1	=	No	Parity
	0	=	Par	ity

Bit 5, Bit 4

0	0	5	Data	Bits
0	1	6	Data	Bits
1	0	7	Data	Bits
1	1	8	Data	Bits

- 3. Receive Synch Register Contains the character that will be detected during Receive as the Synchronization Character.
- 4. Transmit Data Register Contains the Data Character to be transmitted. It should be loaded only after the adapter has indicated that a character is needed for transmission. The character needed for transmission flag will be reset until the character is transmitted and a new character is required.

INTERRUPT CONTROL

The Synchronous I/O Adapter provides two interrupt request signals to the CPU:

Priority Level No. 2 (No. 3 is highest) - A character is received and available. Identical to IFL status bit 7.

Priority Level No. 1 - A character is needed for transmission. Identical to IFL status bit 6.

PIN	CKT	DESCRIPTION
1	AA	Protective Ground
2	BA	Transmitted Data
3	BB	Received Data
4	CA	Request to Send
5	CB	Clear to Send
6	СС	Data Set Ready
7	AB	Signal Ground
15	DB	Transmit Clock
17	DD	Receive Clock
20	CD	Data Terminal Ready

Connector: Cannon DBC-25S

Table 12R-1-1 Synchronous I/O Adapter Pin Assignment EIA-RS232C Signals

This interface satisfies the requirements of the standard synchronous interface between data terminal and data communications equipment defined by EIA Standard RS 232C.

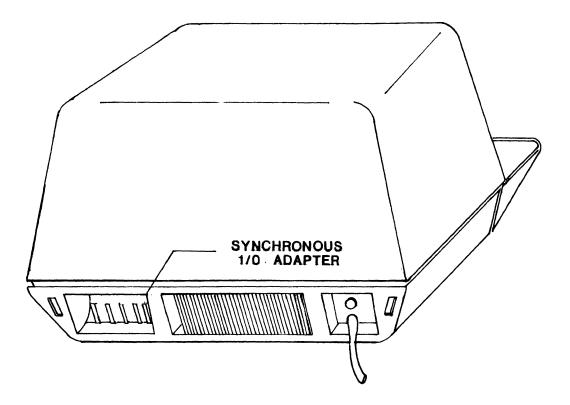

Figure 12R-1. External Connector to Synchronous I/O Adapter

Figure 12R-1 illustrates the Synchronous I/O Adapter connector location.

SECTION 13R

INPUT/OUTPUT MICROPROCESSOR

The Input/Output Microprocessor (IOM) manages all data transfers between the memory and the device controller housed in the OP-1/R. All data transfers are performed on a cycle steal basis transparent to the CPU activity. The CPU is interrupted after the completion of an I/O operation. Data is transferred at a rate of 7 microseconds/byte.

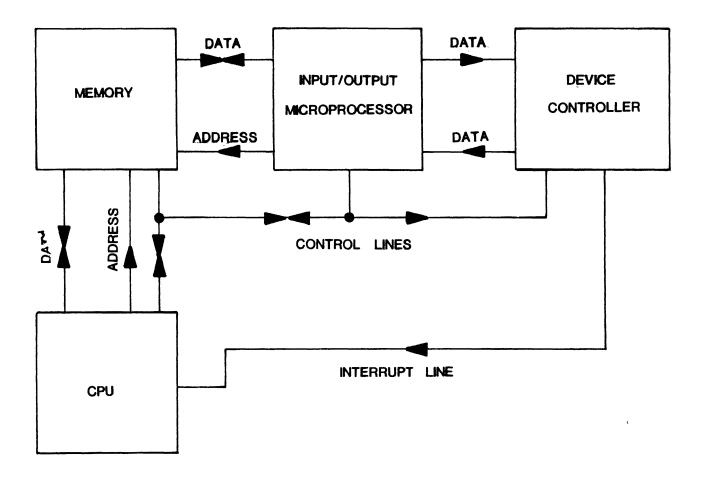

FIGURE 13R-1 BLOCK DIAGRAM

The device controller is wired to the Interrupt Bus and has two sets of reserved memory locations assigned to it.

Standard assignments have been made for purposes of software development only. (See Figure 13R-2). Reserved memory and interrupt assignments may be changed by altering jumpers on the IOM board.

INTERRUPT PRIORITY	COMMAND LOCATIONS (PRIMARY)	COMMAND LOCATIONS (SECONDARY)
7,6	0808 – 080E	0848 - 084E
5	0810 - 0817	0850 - 0857
4	0818 - 081E	0858 – 085E
3	0820 - 0827	0860 - 0867

FIGURE 13R-2

Refer to OP-1 Reference Manual for Device Controller information. This single channel IOM will support one Device Controller.
