

WANG

DISK PROCESSING UNIT

Model: 2280

**Customer Engineering
Product Maintenance Manual**

741-0971

PREFACE

The purpose of this manual is to provide the Wang-trained Customer Engineer (CE) with instructions to operate, troubleshoot and repair the Disk Processing Unit Model 2280.

Second Edition (August 1984)

This edition is the converted number for and obsoletes document number 729-0971. It also incorporates Publication Update Bulletin (PUB), 729-0971-1. This edition of the manual may be used only for the purpose stated in the Preface. Updates and /or changes to this document will be published as Publication Update Bulletins (PUB's) or subsequent editions.

This document is the property of Wang Laboratories, Inc. All information contained herein is considered company proprietary, and its use is restricted solely to the purpose of assisting the Wang-trained CE in servicing this Wang product. Reproduction of all or any part of this document is prohibited without the prior consent of Wang Laboratories, Inc.

PUBLICATION UPDATE BULLETIN

DATE: 3/19/84

This PUB: 729-0971-1

Class Code: 3107

Base Document: 729-0971

Previous Notice(s):None

REASON FOR CHANGE:

This PUB corrects a previous error by reversing the photos in figures 2-8, and 2-9 for the proper sequence, enhancing figures 2-12 and 2-13, and adding figures 2-12A and 2-13A.

INSTRUCTIONS:

Remove pages and insert attached pages as follows:

	REMOVE	INSERT
1.	2-11, 2-12	2-11, 2-12

DESCRIP-

TION

SECTION 1

INTRODUCTION

1.1 PURPOSE AND SCOPE

The purpose of this Product Maintenance Manual (PMM) is to provide sufficient information for the Wang CE to install and maintain the Model 2280 Disk Processor. The information is presented as follows:

<u>Section</u>	<u>Title</u>
1	INTRODUCTION
2	INSTALLATION
3	OPERATION
4	MAINTENANCE
5	THEORY OF OPERATION
Appendix A	DISK ERROR CODES
Appendix B	DISK SECTOR LAYOUT
Appendix C	BILL OF MATERIAL
Appendix D	SCHEMATICS

1.2 RELATED PUBLICATIONS

Following is a list of documentation categories referenced by this PMM. Documentation from these other categories is required for the performance of certain installation/maintenance tasks.

Phoenix Disk Drive -- III.A.7
 Disk Diagnostics -- IV.C.1
 2280 DPU-to-2280 DPU/MUX Conversion -- I.B.2
 22C03, 22C11, 22C32 Disk I/O Controllers -- IV.B.1

1.3 FUNCTIONAL DESCRIPTION

The 2280 DPU (Disk Processing Unit) controls all disk drive operations (such as reading, writing, and head positioning) for the CDC Model 9448 Cartridge Module Disk Drive (CMD)--commonly called the "Phoenix"--when the drive is a component in a 2200VP/LVP/MVP/SVP Computer System. The DPU permits two Phoenix drives to be daisy-chained, providing up to 162 megabytes (approximate) of on-line storage. The 2280 processor (WL No. 187-2200-80) consists of nine printed circuit boards and a motherboard contained in a 2200S chassis. This chassis is housed (located) in the bottom of the Phoenix cabinet/stand. All printed circuit boards are defined in section 2.5.2.

The 2280 DPU connects to a 22C03, 22C11, or 22C32 disk I/O controller in the CPU via a 12-ft (3.6-m) twisted pair cable. The processor connects to the disk drive via two 15-ft (4.5-m) ribbon cables. Figure 1-1 shows a dual disk drive 2200/2280 system configuration.

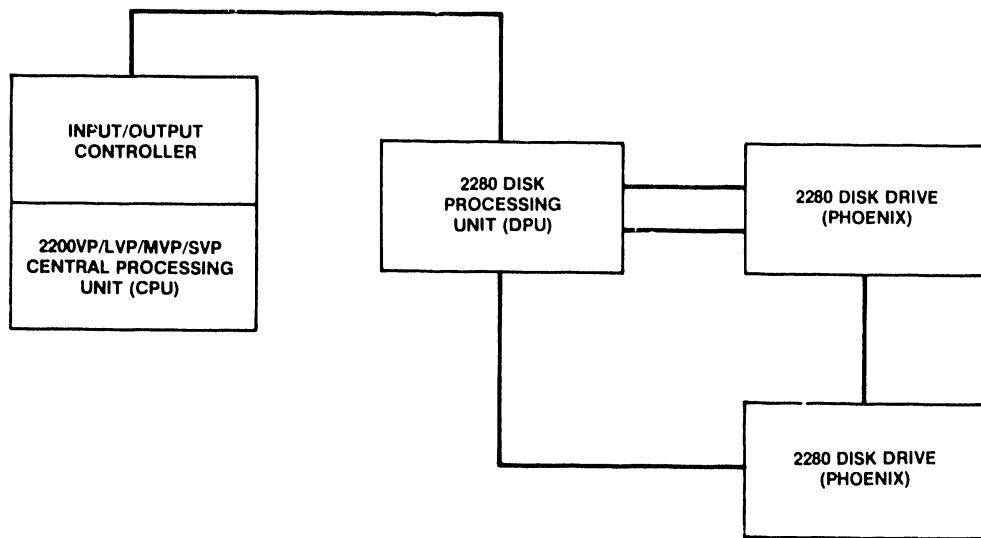

Figure 1-1. 2200/2280 System Configuration

1.4 SPECIFICATIONS

The specifications for the 2280 DPU system are listed below as follows:

Physical Dimensions

Height - 9 in. (23 cm)
Width - 16 in. (41 cm)
Depth - 21 in. (53 cm)

Power Requirements

115 or 230 Vac $\pm 10\%$
50 or 60 Hz ± 1.0 Hz
230 Watts

Fuses

3.0 A (SB) for 115 Vac
1.5 A (SB) for 230 Vac

Operating Environment

Temperature - 60°F to 80°F (15°C to 27°C)
Relative Humidity - 40% to 60% (noncondensing)

Heat Output

787 BTU/hr (197 Kcal/hr)

Cables

Power - 10 ft (3.0 m)
Data - 15 ft (4.5 m)

SECTION

2

INSTAL-

LATION

SECTION 2
INSTALLATION

2.1 SITE PREPARATION

For information concerning preinstallation site planning and preparations, refer to the corporate "Customer Site Planning Guide" WL No. 700-5978, its updates, and CE documentation category I.A.7.

2.2 PRE-UNPACKING INSPECTION

Before unpacking the 2280 DPU, check the packing slip to ensure that the proper equipment has been delivered. After checking the slip, visually inspect the container carefully for any indications of possible shipping damage (crushed edges or corners, puncture holes, tears, etc.). If any damage is noted, file an appropriate claim promptly with the carrier involved and notify the WLI Distribution Center (Department 90), Quality Assurance Department, of the nature and extent of the damage, making arrangements for equipment replacement, if necessary.

2.3 UNPACKING INSTRUCTIONS

- a. Using an x-acto knife, cut the tape securing the shipping carton cover.
- b. Open the box and remove the instapack covering the top of the unit.
- c. Remove the unit from the carton.
- d. Save the shipping carton and protective padding for use when reshipping the unit.

2.4 PRE-INSTALLATION INSPECTION

- a. Remove the top cover from the unit (see section 4.5).
- b. Inspect the DPU chassis for damaged or loosened assemblies. Also check for loose hardware or debris. If any damage is noted, notify the WLI Distribution Center (Department 90), Quality Assurance Department, of the nature and extent of the damage, making arrangements for equipment replacement, if necessary.
- c. Thoroughly clean the unit. Use a soft bristle brush and a vacuum cleaner to remove dust from the inside of the unit. Use a mild detergent and a soft cloth or sponge to remove dirt and grime from the chassis. Do not use abrasive or corrosive materials.

2.5 INITIAL SETUP

This section consists of:

- a. ac input voltage selection information
- b. photographs of the circuit boards giving all pertinent information concerning each board (if applicable) along with motherboard loading
- c. an explanation of system interconnection cabling.
- d. device address selection information.

Section 2.6 (Installation Procedure) helps link together the various information items contained in this section.

2.5.1 Motherboard AC Input Voltage Selection Jumpers

Jumper wires are provided on the motherboard for ac input voltage selection (115V or 230V). Two jumpers are installed for 115Vac and one jumper for 230Vac. Figure 2-1 shows the positions of these jumpers. Be certain the jumper configuration is correct for the supplied ac voltage (see table 2-1).

TABLE 2-1 Voltage Selection Jumpers

JUMPER	115VAC	230VAC
A	IN	OUT
B	OUT	IN
C	IN	OUT

Figure 2-1. AC Input Voltage Selection Jumpers

2.5.2 Circuit Boards

Figures 2-2 through 2-9, 2-11, and 4-1 illustrate the individual printed circuit boards that comprise the 2280 DPU. The specific reference to each figure is as follows:

<u>WL Number</u>	<u>Nomenclature</u>	<u>Figure</u>
210-7415	Prime Circuit Board	2-2
210-7421-A	ALU/MUX Interface Board	2-3
210-7422	ECC/Device Interface Board	2-4
210-7423-A	RAM/PROM Control Board	2-5
210-7424	I/O Controller Board	2-6
210-7715	2280 MUX Disk Controller	2-7
210-7716	Motherboard	2-11
210-7717	2280 MUX Master	2-8
210-7718	2280 MUX Slave	2-9
210-L567	Regulator Board	4-1

2.5.3 Motherboard/PCB Layout

The locations of the 2280 DPU circuit boards in relation to the motherboard/chassis are shown in figures 2-10 and 2-11. Ensure that all fingerboard connectors are clean prior to installing the boards in the DPU. (An ink eraser should be used to clean the pins if necessary.)

Figure 2-9. WL No. 210-7718 MUX Slave Board

Figure 2-10. Circuit Board Loading

Figure 2-11. WL No. 210-7716 Motherboard

2.5.4 Input/Output Cable Connections (see figure 2-12)

Refer to documentation category 3105 for Phoenix disk drive connection locations.

CAUTION:

Since the "A" the "B" cables are not keyed, carefully check the routing of the cables (following steps) to ensure that pin 1 on the drive connector receiving the cable connects to pin 1 on the appropriate DPU interface connector. Pin 1 of the cables is designated on the connectors of the cable by an embossed triangle. Pin 1 is also recognized by the black strand of the ribbon cable that is attached to that pin.

A 36-pin I/O cable (WL No. 220-0365) connects J1 on the 210-7421-A board in the DPU (see figure 2-3) to the appropriate jack on the I/O controller in the CPU.

A 60-pin "A" cable (WL No. 220-3041-22) connects J3 on the 210-7422 board in the DPU (see figure 2-4) to J1 on I/O logic board EM1 in the Phoenix drive.

A 26-pin "B" cable (WL No. 220-3033-36) connects J2 (Device No. 1 connector) on the 210-7422 board in the DPU (see figure 2-4) to J3 on Control/Mux logic board E 2 in the Phoenix drive.

If only one disk drive is connected to the DPU, a terminator board (WL No. 726-5790) is installed in J2 on I/O logic board EM1 in the Phoenix drive; otherwise, the terminator is installed in the same location in the second drive.

If two disk drives are connected to the DPU, the following cable connections are also required.

A 60-pin "A" cable (WL No. 220-3041-7) connects J2 on the I/O logic board EM1 in the first Phoenix drive to J1 on I/O logic board EM1 in the second Phoenix drive.

A 26-pin "B" cable (WL No. 220-3033-21) connects J1 (Device No. 2 connector) on the 210-7422 board in the DPU (see figure 2-4) to J3 on Control/Mux logic board EM2 in the second Phoenix drive.

2.5.5 Device Address Plug (on Phoenix disk drive)

A device address plug must be inserted into the socket at the left of the START/STOP indicator switch on the front panel of each disk drive. The address plug must correspond with the device number assigned to the 210-7422 connector receiving the "B" cable from the given drive. That is, install a "1" device address plug in the disk drive whose "B" cable is attached to connector J2 (Device No. 1) on the 210-7422 board in the DPU, and install a "2" plug in the drive whose "B" cable is attached to connector J1 (Device No. 2) on the 210-7422 board.

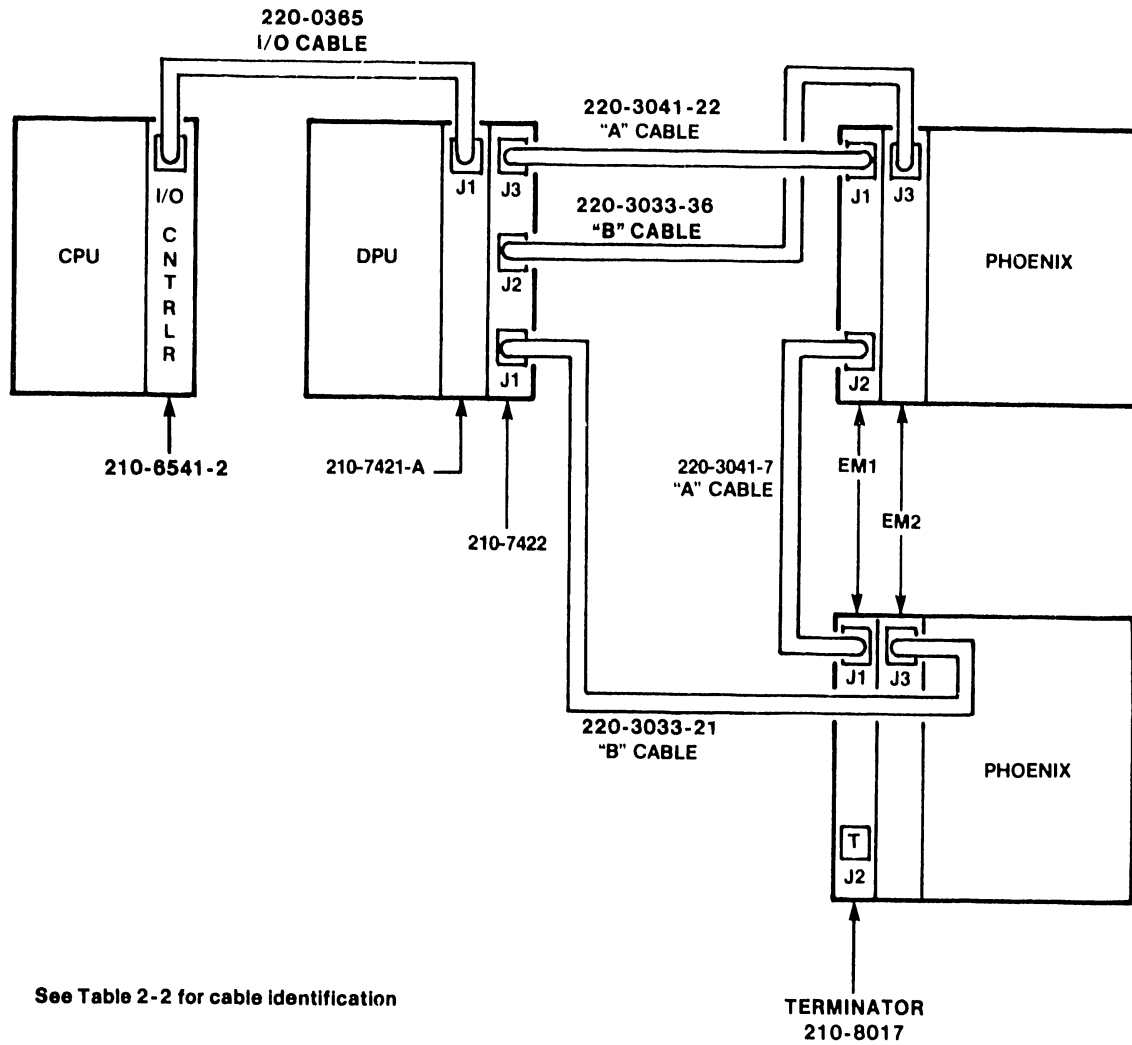

FIGURE 2-12 SYSTEM INTERCONNECTION DIAGRAM WITH ONE DPU

See Table 2-2 for cable identification.

*For Daisy Chain Configuration Only.

2.5.6 Shielded Cable Connections

The ribbon cable connecting the 210-7422 PCB to the disk drive is copper clad for good shielding. To ensure proper contact, install the DPU cable clamp at the 210-7422 PCB as follows:

- a. Loosen and remove the clamp screws that secure the two halves of the DPU cable clamp to the 210-7422 PCB (see figure 2-4).
- b. Remove the removable half of the cable clamp from the 210-7422 board.
- c. Connect the ribbon cable to the fixed half of the DPU cable clamp by inserting the grounding clip (only) between the copper shield and the outer cable jacket of the ribbon cable (see figure 2-14, A).
- d. Push the ribbon cable onto the clamp; fully inserting the grounding clip (see figure 2-14, B).
- e. Install the removable clamp in the same manner (see figure 2-14, C).
- f. Assemble and secure the two halves of the clamp: tighten the two clamp screws evenly, ensuring that the copper shield remains in good contact with both grounding clips (see figure 2-14, D).

CAUTION

Do not overtighten the clamp screws which secure the two halves of the clamp; otherwise, damage to the cable may result.

- g. All three ribbon cables are secure in the same fashion (refer to figure 2-14, E).

Figure 2-14. Shielded Cable Installation (Sheet 2 of 3)

Figure 2-14. Shielded Cable Installation (Sheet 3 of 3)

2.6 INSTALLATION PROCEDURE

- a. Ensure that the ac input voltage selection jumpers on the motherboard are positioned correctly for the supplied voltage (see section 2.5.1).
- b. Check to see that all circuit boards are properly seated in the appropriate locations (see section 2.5.3).
- c. Attach all system interconnection cables (see section 2.5.4) ensuring that the cable shields are properly connected (see section 2.5.6).
- d. Check to see that the appropriate device address plug is in the disk drive (see section 2.5.5).
- e. Be certain the ac power switch is OFF, and then plug the ac power cord in.
- f. Set the ac power switch ON, then check and adjust, if necessary, all power supply voltages (see section 4.4).
- g. Run all appropriate 2280 disk diagnostics to confirm proper operation of the system (see section 4.2).
- h. Replace the unit cover(s) and place the DPU in the disk drive stand as shown in figure 2-15.
- i. The system is now ready for customer use.

Figure 2-15. DPU Mounted In Bottom Of Stand

SECTION

3

OPERA-

TION

SECTION 3

OPERATION

For information concerning operation/programming of the 2280 Disk System (Phoenix drive and DPU) refer to Wang BASIC-2 Disk Reference Manual, WL No. 700-4081F (III.A.0), and Model 2280 Disk Drive User Manual, WL No. 700-5216 (III.A.10).

SECTION

4

**MAINT-
ENANCE**

SECTION 4
MAINTENANCE

4.1 RECOMMENDED TEST EQUIPMENT/TOOL LIST

- a. Digital voltmeter--(acceptable type/equivalent: Fluke No. 8000A).
- b. Oscilloscope--(acceptable type/equivalent: Tektronix No. 465).
- c. Heavy duty screw driver with insulated handle (WL No. 726-9411).
- d. Small slot screwdriver with insulated handle (WL No. 726-9406).

4.2 DIAGNOSTICS

Refer to documentation category IV.C.1 for information concerning disk diagnostics.

4.3 PREVENTIVE MAINTENANCE

To ensure trouble-free operation, the 2280 DPU must have periodic preventive maintenance, consisting of inspection, cleaning, and adjustments. The following preventive maintenance routine should be performed once every six months. This maintenance schedule assumes a clean operating environment and a normal operating time during the standard five-day, 40-hour weeks. A dusty environment or any substantial increase in system operating time will require that the preventive maintenance be scheduled at closer intervals. In addition, this preventive maintenance routine should be performed during each unscheduled service call.

- a. Check the unit cooling fan for proper operation.
- b. Set the DPU ac power switch OFF.
- c. Remove the screws securing the top cover and remove the cover (see Section 4.5).
- d. Remove each circuit board from the DPU and clean the finger connectors with an ink eraser.
- e. Check to see that all circuit boards are at the latest electronic revision (E-REV). Refer to Mandatory Update Bulletin in documentation category I.B.0 for ECO implementation procedures.

- f. Use a soft-bristle brush and a vacuum cleaner (WL No. 726-9518) to remove dust from the inside of the DPU.
- g. Reinstall all circuit boards in the appropriate locations (see section 2.5.3).
- h. Set the ac power switch ON.

NOTES:

- 1. Before making any adjustment, be certain the measuring instrument is properly calibrated.
- 2. Electrical adjustments should be performed only when the parameter measured is out of tolerance. Do not make electrical adjustments indiscriminately.
- i. Check and adjust, if necessary, the DPU power supply voltages according to the procedure given in section 4.4.
- j. Run the 2280 disk diagnostics (see section 4.2) to confirm proper operation of the DPU and then replace the top cover.
- k. Use a mild detergent and a soft cloth or sponge to remove dirt and grime from the DPU chassis. Do not use abrasive or corrosive chemicals.

4.4 POWER SUPPLY VOLTAGE ADJUSTMENT

- a. Set the ac power switch OFF.
- b. Remove the top cover of the unit. (see section 4.5).
- c. Set the ac power switch ON.
- d. Check the dc voltages with a digital voltmeter for the values listed in table 4-1. (The test points for monitoring the voltages are also given in table 4-1.) Adjust the trimpots where indicated in figure 4-1 to obtain correct voltage levels where necessary.

NOTE:

Be sure to connect the common lead of the voltmeter to a +0V connection, NOT the chassis or I/O controller rail. Erroneous readings will result if chassis ground is used as the voltmeter reference. The oscilloscope ground clip should also be connected to +0V, NOT chassis ground.

- e. Using an oscilloscope with the vertical sensitivity set at 1V/cm and a X1 probe, measure the ripple at the points indicated in table 4-1. AC ripple must not exceed the limits specified.

TABLE 4-1 DC VOLTAGE SPECIFICATIONS

VOLTAGE	L567 TEST POINT	L567 ADJUST	LIMITS	
			VOLTAGE	RIPPLE
+5VRM	Pin 1 ₁	R17	+4.90 to +5.10	15 mv p-p
+5VRL	Pin 2 ₁	R2	+4.90 to +5.10	15 mv p-p
+8VR	Pin 12 ₁	R13	+8.50 to +8.80	20 mv p-p
+12VR	Pin 15 ₁	R30	+11.80 to +12.20	15 mv p-p
-12VR	Pin 5 ₂	R34	-11.80 to -12.20	15 mv p-p
-15VR	Pin 6 ₂	R40	-14.80 to -15.20	25 mv p-p

4.5 REMOVAL/REPLACEMENT PROCEDURES

4.5.1 Top Cover

Remove the four screws that secure the top cover (see figure 4-2) and remove the cover from the unit.

4.5.2 Bottom Cover

Remove the four screws that secure the bottom cover (see figure 4-3) and remove the cover from the unit.

Figure 4-1. WL No. 210-L567 Regulator Board Potentiometers

Figure 4-2. Top Cover Removal

Figure 4-3. Bottom Cover Removal

4.6 DISK ERROR CODES

ERR I90 -- Disk Hardware Error

The disk did not properly respond to the system at the beginning of a read or write operation.

ERR I91 -- Disk Hardware Error

The disk is not in a "ready" condition.

ERR I92 -- Timeout Error

The disk did not respond to the system in the proper amount of time during a read or write operation.

ERR I93 -- Format Error

The disk media is not properly formatted.

ERR I94 -- Format Key Engaged

Not applicable for the 2280 DPU.

ERR I95 -- Seek Error

The specified sector could not be found on the disk.

ERR I96 -- Cyclic Redundancy Check Error

The data in a sector was read (or written) incorrectly.

ERR I97 -- Longitudinal Redundancy Error

The data was not transmitted to the CPU correctly during a read operation.

ERR I98 -- Illegal Sector Address

The sector address is greater than that allowed for the specific disk capacity.

ERR I99 -- Read After Write Error

The data read did not compare to that that was written during a read after write operation.

OPERA-

TION

CHAPTER 5

THEORY OF OPERATION

5.1 BLOCK LEVEL

This section consists of a brief explanation of the circuitry that comprises the four major logic boards in the DPU. The section is divided into five subsections--one for each logic board.

5.1.1 WL No. 210-7423-A RAM/PROM Control Board (see figure 5-1)

5.1.1.1 Clock (see timing chart, figure 5-2) -- The clock circuit produces 16 clock cycles, each 100 nsec in duration. This results in a machine-cycle speed of 1.6 usec (1600 nsec). The clock cycles are applied to a bcd-to-decimal (4-to-10) decoder which generates 8 clock pulses that are used in the DPU. These clock pulses and the events that occur at that specific time are listed below.

T0 - Clocks instruction through Rom Bit Latch as R_{0-15} .
Clocks Status Register 0.

T2 - Clocks data into the A and K Registers.

T3 - Clocks data into Memory Register.

T4 - Clocks Instruction Counter.
Loads/clears Memory Address Register.
Generates A and K Register Strokes.
Combines with CNTRL-1 to generate CNTRL14 which--
Clocks Read/Write/Format Latch.
Fires Strobe One-Shot.
Sets/resets Busy F/F.
Clocks ECC Shift Register.
Combines with CNTRL-3 to generate CNTRL34 which--
Clocks Tag Latches.
Clocks Select Latches.

T5 - Increments/decrements Memory Address Register.

T8 - Clocks Carry F/F.
Clocks Equal F/F.

T9 - Strokes data from RAM through Memory Register.

T2-5 - Generates RAM write pulse.

5.1.1.2 Programmable Read Only Memory (PROM) -- The PROM contains the microprogram that controls the operations of the DPU. The 2280 DPU utilizes four INTEL 2716 PROM chips. Each PROM contains a 2K x 8-bit matrix. Since the DPU instruction set requires 16-bit words, two PROM's are selected at the same time to provide the instruction. With this requirement, the total read only memory capacity is 4096 words or instructions.

The PROM output bits are clocked through D-type latches at time T0 as ROM bits R_{0-15} .

Figure 5-1. WL No. 210-7423-A RAM/PROM Control Block Diagram

10 MHz CLK T=100 nSEC

Figure 5-2. Timing Chart

The PROM is addressed by an Instruction Counter composed of three AM2911 microprogram sequencer chips. Twelve bits (IC₀₋₁₁) are applied to the PROM by the instruction counter; IC₀₋₁₀ provide the addressing and IC₁₁ produces the appropriate chip select (CS₁₋₂) signal. CS₁ selects the lower 2K of PROM and CS₂ selects the higher 2K. The PROM space is allocated as follows.

0K-2K = main body of microprogram
 2K-3K = alternate sector routine, copy write error routine, error correction routine, and diagnostics
 3K-4K = diagnostics

Normally the instruction counter increments by one at time T4. However, during execution of the microprogram, it is necessary to jump (branch) to a location other than that immediately following. Three signals are provided to accomplish the jump (branch): UB--Unconditional Branch, SB--Subroutine Branch, and 256--256 step branch.

5.1.1.3 Random Access Memory (RAM) -- The RAM is used to store flags, pointers, and status information required for execution of the microprogram as well as the data that is to be exchanged between disk and CPU. The RAM consists of eighteen 2114-L integrated circuits with a capacity of 1024 x 4 bits resulting in a total storage capacity of 9,216 bytes.

The Memory Address Register (MAR) provides 16 bits (AD₀₋₁₅) for the addressing of the RAM. AD₀₋₉ supply the actual RAM address while AD₁₀₋₁₅ generate the appropriate chip select (1K-8K) signal. The MAR increments or decrements at time T5. It can also be loaded (preset to a certain address) or cleared (reset to an address of zero) at time T4. The address to which the MAR can be loaded is provided through the Memory Address Multiplexer (MA₀₋₇). The inputs to the multiplexer that can be selected to provide the address are either ROM bits 0-7 (R₀₋₇) or the A and K Register bus (AK₀₋₇).

Data is transferred to/from RAM through the Memory Register (MB₀₋₇). The 2280 DPU utilizes two AM2905 Bus Transceiver chips for the MAR. Data that is to be written into RAM is input to the Memory Register from the A bus or the Memory Register bus (M₀₋₇). Data that is read from RAM is applied to the Memory Register bus (M₀₋₇). RAM space is allocated as follows.

1st 1/4K (256 bytes) = flags and pointers
 Next 2K = cache for read
 Next 4K = cache for multi-sector write
 Next 8K = read/write buffer for COPY
 2nd page of last 'K' = alternate sector RAM

READ -- 256-1K-1K
 WRITE -- 256-1K-1K-1K-1K
 COPY -- 256-1K-1K-1K-1K-1K-1K-1K

The Error Check Circuitry (ECC) in the RAM functions as a 35-shift polynomial in a similar manner as that found in the OIS/VS systems.

5.1.1.4 Control Circuit -- Refer to section 5.3 (Instruction Set) for information concerning the control circuitry on the 210-742-A board.

5.1.2 WL No. 210-7421-A ALU/MUX Interface Board (see figure 5-2)

5.1.2.1 Arithmetic/Logic Unit (ALU) -- Two 74181 integrated circuits, designed to perform specific arithmetic or logical operations as directed by the microprogram, comprise the ALU.

The ALU data inputs are referred to as the A-bus and the B-bus. The A-bus inputs are from the A or K Registers (AK_{0-7}). The B-bus is the output of a multiplexer, incorporating memory (M_{0-7}) and ROM bits (R_{0-7}) as selectable inputs.

The ALU output is the C-bus (C_{0-7}). Data on this bus can be input to the A Register or K Register.

5.1.2.2 A Register -- The general purpose A-Register stores data from: 1) the CPU, 2) Status Register 0, 3) the ECC Shift Register, or 4) the ALU. The contents of the A-Register can be processed by the ALU, stored in memory, or input to the Track, Head, or Sector Registers (THS_{0-7}).

5.1.2.3 K-Register -- The general purpose K-Register stores data from the ALU or acts as Status Register 1. The contents of the K-Register can be processed by the ALU or stored in memory.

5.1.2.4 Status Register 0 (STO) -- STO stores seven CPU/DPU conditions which can be input to the A-Register, via the BO_{0-7} bus, for monitoring or testing. The conditions are as follows:

*REQ (Bit 0)	--	When active, indicates the Output Bus Buffer has received a byte of data from the CPU.
*CAB (Bit 1)	--	When active, indicates a carry resulted from a preceding ALU arithmetic operation or from the execution of a "Set Carry" instruction.
*GKBD (Bit 2)	--	When active, indicates the CPU is ready to receive input from the DPU.
REINIT (Bit 3)	--	When active, indicates the CPU is sending address information next. When inactive, indicates the CPU is sending data next.
DN #3 (Bit 4)	--	When active, indicates that selection of drive 2 in a daisy-chain configuration is desired.
A=B (Bit 5)	--	When active, indicates the data on the ALU A-bus is equal to that on the B-bus.
AD7 (Bit 6)	--	The eighth ($2^8 = 128$) RAM address bit.

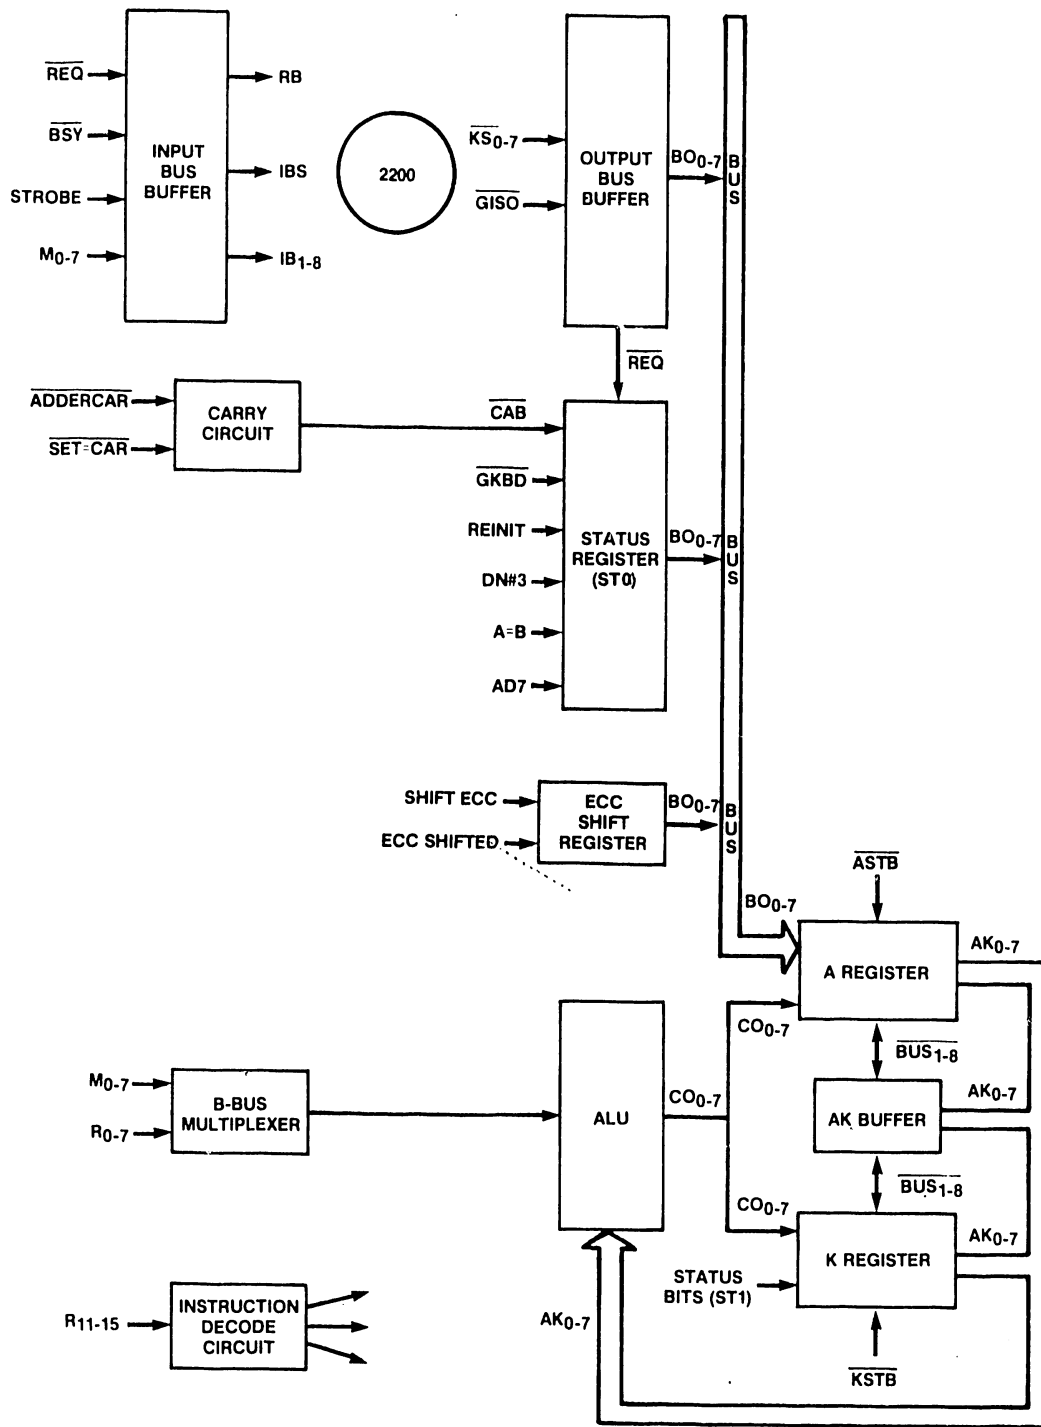

Figure 5-3. WL No. 210-7421-A ALU/MUX Interface Block Diagram

5.1.2.5 Status Register 1 (ST1) -- The K-Register acts as ST1. Seven bits representing DPU/disk drive conditions can be selected as inputs to the K-Register. Once in the register, the bits can be tested for the various conditions. The bit representation is as follows:

W/P (Bit 1)	--	When active, indicates the disk drive is write protected.
ERROR (Bit 2)	--	When active, indicates an address error was detected.
DERROR (Bit 3)	--	When active, indicates a disk drive fault occurred or a seek error was detected by the disk drive.
*DONE (Bit 4)	--	When active, indicates 256 bytes of data have been transferred to/from the disk.
*NULL (Bit 5)	--	(Not Used)
READY (Bit 6)	--	When active, indicates the disk drive is "on cylinder" and "ready".
SECTOR (Bit 7)	--	When active, indicates the sector counter is equal to the desired sector, which is present on the THS (<u>T</u> rack/ <u>H</u> ead/ <u>S</u> ector) bus.

5.1.2.6 Input Bus Buffer -- The Input Bus Buffer provides the interface for data being sent to the CPU from the DPU. Data is input to the buffer from the Memory Register (M₀₋₇).

5.1.2.7 Output Bus Buffer -- The Output Bus Buffer provides the interface for data being sent to the DPU from the CPU. Data is output from the buffer to the A-Register via BO₀₋₇. When the buffer receives a byte of data, it generates a request (REQ) signal. REQ is monitored by the DPU, and when the signal is active, the microprogram causes the hardware to read in the data.

5.1.2.8 Instruction Decode Circuit -- ROM bits R₁₁₋₁₅ are applied to a 74154 one-of-sixteen decoder which produces the control signals necessary for execution of the microinstructions by the hardware.

5.1.3 WL No. 210-7424 I/O Controller Board (see figure 5-4)

5.1.3.1 Track Register -- The Track Register holds the desired track (cylinder) address as input from the AK bus. The address is output to a buffer, via the THS bus, from where it is sent to the disk drive.

5.1.3.2 Head Register -- The Head Register holds the desired head number and volume select bit as input from the AK bus. The head/volume select information is output to a buffer, via the THS bus, from where it is sent to the disk drive.

5.1.3.3 Sector Register -- The Sector Register holds the desired sector number as input from the AK bus. The number is output to the Sector Comparator, via the THS bus, where it is checked against the output of the Sector Counter.

5.1.3.4 Command Register -- The Command Register holds the disk drive control select bits (for example, write gate, read gate, and return to zero). The control information is output to a differential buffer to be sent to the disk drive.

5.1.3.5 Bit/Byte Counter -- The Bit/Byte Counter keeps track of the number of bytes of data transferred between DPU and disk. The counter generates certain control signals depending on the number of bits/bytes that have been counted.

5.1.3.6 Serial-to-Parallel, Parallel-to-Serial (SP/PS) Converter -- The SP/PS accepts eight parallel bits of data from the Memory Register (M_{0-7}) and converts the information to serial and adds clock pulses between data bits. The serial data is then transmitted to the disk drive.

The converter also accepts serial Read Data and changes it to eight parallel bits of data. If the data that is read is address information, it is input to the Address Comparator; otherwise, the data is sent to memory.

5.1.3.7 Address Comparator -- The Address Comparator checks the address read from the disk with the desired address that is present on the THS bus. If the two are not the same, the comparator flags an error.

5.1.3.8 Control Circuit -- Refer to section 5.3 (Instruction Set) for information concerning the control circuitry on the WL No. 210-7424 board.

Figure 5-4. WIL No. 210-7424 I/O Controller Block Diagram

5.1.4 WL No. 210-7422 ECC/Device Interface Board (see figure 5-5)

5.1.4.1 Differential Buffers -- The Differential Buffers provide the interface between DPU and disk drive. The buffers convert TTL voltage levels to differential voltage levels and vice versa.

5.1.4.2 Sector Counter -- The Sector Counter increments every time a sector mark pulse is received from the disk drive. It is reset (cleared) when the index pulse is received.

5.1.4.3 Sector Comparator -- The Sector Comparator checks the desired sector number that is present on the THS bus against the count from the sector counter. When the two are equal, indicating the correct disk sector is under the read/write head, an EQUAL signal is generated to inform the microprogram.

5.1.4.4 ECC -- The Error Correction Circuit along with an ECC routine in the microcode is responsible for detecting and correcting any single-bit errors that occur during a read operation. Figure 5-6 is a detailed flowchart illustrating the ECC code handling routine.

Figure 5-5. WL No. 210-7422 ECC/Device Interface Block Diagram

Figure 5-6. ECC Code Handling Flowchart

5.1.5 WL No. 210-L567 Regulator Board (see schematic)

There are six regulated voltages in the DPU power supply, each independently variable. All six supplies are of the series pass variety, each controlled by an IC voltage regulator. There are four transformer generated, full wave unregulated supplies which provide the necessary voltages for the regulators.

The six regulated supplies are +5VRL for the TTL logic and +5VRM, +8VR, +12VR, -12VR, and -15VR for the PROM's and RAM's. As all regulators operate in the same manner, only the +5VRL supply is discussed here.

The heart of the regulated supply is the voltage regulator (L4). Unregulated +14V is applied to L4 pin 8 to provide the operating voltage for the IC. Pin 4 of the regulator is the output from a reference amplifier in the IC. The output of this amplifier is applied to the voltage divider network R1, R2, and R3. The reference amplifier contains a current source and temperature compensator to prevent drifting.

The voltage present at the wiper of potentiometer R2 is applied to the non-inverting input of the error amplifier (regulator pin 3). By varying the voltage at the non-inverting input, the output voltage changes.

Since the IC regulator cannot supply large output currents, external circuitry must be provided for this purpose. Pin 7 of the regulator is the collector output of the internal series pass transistor which provides the necessary drive for transistor Q5. Q5 provides the necessary current for driver X8, which in turn controls the series pass transistors X6 and X7.

The error amplifier constantly monitors the regulated output voltage by sampling the output voltage at the inverting input (regulator pin 2). Voltage regulation is performed as follows.

If the output voltage tries to go more positive, the inverting input (pin 2) also follows positive. This results in a more negative input to the internal series pass transistor, causing it to conduct less thus increasing the positive voltage at pin 7. (The voltage drop across R4 is less due to the decrease in current; hence Q5 base tends toward +14V.) Q5 conducts less, driver Q8 controlled by Q5 conducts less, and finally the series pass transistors conduct less, decreasing the output voltage. In a similar manner, the output voltage is increased when a negative output change is detected. Note that no regulation can take place unless there is a change in the output voltage to initiate a correction; therefore, the regulation is less than perfect.

The regulators also employ foldback current limiting as follows.

Resistors R5, R7, and R8 form the external current sensing network. As the current in the external circuit increases, the voltage drop across the sensing network changes, until the internal current limiter transistor is turned off. The output voltage drops to zero and the output current remains at a safe value when the output current exceeds the predetermined value.

Capacitor C8 compensates the internal error amplifier to avoid instability. As mentioned previously, all other regulator circuits operate in the same manner.

Diode D2 connected between L5 pin 1 and L1 pin 1 prevents the +5VRM supply from ever becoming more positive than the +8VR supply. This is necessary to prevent damage to the memory. Also diode D1 prevents the +8VR supply from rising above +14.2V, again to prevent damage to the memory.

5.2 READ/WRITE DATA FLOW

5.2.1 Write Data Flow

Figure 5-5 is a write data flow diagram illustrating the hardware involved when data is read from the 2200, processed through the 2280 DPU, and written onto the disk. The following theory references schematic diagrams located in Appendix D at the end of this document.

Parallel write data enters the 2280 DPU at 7421-2 (KS₀₋₇ to BO₀₋₇) where it goes through the A register as AK₀₋₇. The data is sent via 7423-2 to L40 and L41 (M₀₋₇) and to the RAM. From the RAM the data goes through L40 and L41 (M₀₋₇) to 7424-1 and to L47 (serializer/de-serializer). The data goes out as WDATA to 7424-2 through L32 and L42 and emerges as WRITE DATA (serial) and to the drive.

5.2.2 Read Data Flow

Figure 5-6 is a read data flow diagram illustrating the hardware involved when data is read from the disk, processed through the 2280 DPU, and written into the 2200. The theory discription presented below references schematic diagrams located in Appendix D at the end of this document.

Serial read data from the disk drive enters the 2280 DPU at 7424-1 where is is applied to L47 (serializer/de-serialaizer). The parallel data output from the serializer/de-serializer is sent via 7423-2 to L40 and L41 and to the RAM. From the RAM, it goes to L40 and L41 and to 7421-1. It is now sent via L4 and L11 to the 2200 as IB₀₋₇.

5.3 MICROPROGRAM FLOWCHARTS

Figures 5-9 thru 5-15 are flowcharts of each individual microprogram sequence for the 2280 DPU functional modes of operation.

APPENDIX

A

DISK

ERROR

CODES

APPENDIX A
DISK ERROR CODES

ERR D80

Error: File Not Open

Cause: The file was not opened.

Recovery: Open the file before attempting to read from it or write to it.

ERR D81

Error: File Full

Cause: The file is full; no more information may be written into the file.

Recovery: Correct the program, or use MOVE to move the file to another platter and reserve additional space for it.

ERR D82

Error: File not in Catalog

Cause: A non-existing file name was specified, or an attempt was made to load a data file as a program file.

Recovery: Make sure the correct file name is being used, the proper disk is mounted, and that the proper disk drive is being accessed.

ERR D83

Error: File Already Cataloged

Cause: An attempt was made to catalog a file with a name that already exists in the Catalog Index.

Recovery: Use a different name, or catalog the file on a different platter.

ERR D84

Error: File Not Scratched

Cause: An attempt was made to rename, or write over a file that has not been scratching.

Recovery: Scratch the file before renaming it.

ERR D85

Error: Catalog Index Full

Cause: There is no more room in the Catalog Index for a new name.

Recovery: Scratch any unwanted files and compress the catalog using a MOVE statement, or mount a new disk platter and create a new catalog.

ERR D86

Error: Catalog End Error

Cause: The end of the catalog area is defined to fall within the catalog index, or an attempt has been made to move the end of the catalog area to fall within the area already occupied by cataloged files (with MOVE END), or there is not room left in the Catalog Area to store more information.

Recovery: Correct the SCRATCH DISK or MOVE END statement, or increase the size of the Catalog Area with MOVE END, or scratch unwanted files and compress the catalog with MOVE, or open a new catalog on a separate platter.

ERR D87

Error: No End of File

Cause: No end-of-file record was recorded in the file (with DATASAVE DC END or DATASAVE DA END), and therefore none could be found by the DSKIP END statement.

Recovery: Correct the file by writing an end-of-file trailer after the last data record.

ERR D88

Error: Wrong Record Type

Cause: A program record was encountered when a data record was expected, or vice versa.

Recovery: Correct program. Be sure the proper platter is mounted and be sure the proper drive is being accessed.

ERR D89

Error: Sector Address Beyond End of File

Cause: The sector address being accessed by the DATALOAD DC or DATASAVE DC operation is beyond the end-of-file. This error can be caused by a bad disk platter.

Recovery: Run the program again. If error persists, use a different platter or reformat the platter. If error still exists, contact your Wang Service Representative.

ERR I90

Error: Disk Hardware Error

Cause: The disk did not recognize or properly respond to the System at the beginning of a read or write operation (the read or write has not been performed).

Recovery: Run the program again. If error persists, contact your Wang Service Representative.

ERR I91

Error: Disk Hardware Error

Cause: A disk hardware error occurred, e.g., the disk is not in file-ready position. This could occur, for example, if the disk is in LOAD mode or power is not turned on.

Recovery: Ensure disk is turned on and properly set up for operation. Set the disk into LOAD mode and then back into RUN mode with the RUN/LOAD selection switch. The check light should then go out. If error persists, call your Wang Service Representative. (Note: disk must never be left in LOAD mode when turned on.)

ERR I92

Error: Time-out Error

Cause: The disk did not respond to the system during a read or write operation in the proper amount of time (time-out).

Recovery: Run program again. If error persists, reinitialize disk - if error still occurs, contact your Wang Service Representative.

III.A.10 M-2

ERR I93

Error: Disk Format Error

Cause: A disk format error was detected during a disk read or write. The disk is not properly formatted. The error can be either in the disk platter or the disk hardware.

Recovery: Format the disk again; if error persists, call your Wang Service Representative.

ERR I94

Error: Format Key Engaged

Cause: The disk format key is engaged (the key should be engaged only when formatting a disk).

Recovery: Turn off the format key.

ERR I95

Error: Seek Error, or Platter Protected

Cause: A disk-seek error occurred; the specified sector could not be found on the disk. This error may indicate a bad format, or it may result from an attempt to write to a protected platter.

Recovery: Run program again. If error persists, reinitialize (reformat) the disk. If error still occurs, call your Wang Service Representative.

ERR I96

Error: Cyclic Read Error

Cause: A cyclic redundancy check (CRC) error occurred during a disk read operation; the sector being addressed has never been written to or was incorrectly written.

Recovery: If not formatted, format the disk. If the disk was formatted, rewrite the bad sector. If error persists, use a different disk platter. If error persists on a fixed platter, call your Wang Service Representative.

ERR I97

Error:

LRC Error

Cause:

A disk longitudinal redundancy check (LRC) error occurred when reading a sector. This usually indicates a data transmission error occurred when the sector was read or written.

Recovery:

If error persists, rewrite the sector. If the error still persists, call your Wang Service Representative.

ERR I98

Error:

Illegal Sector Address or Platter Not Mounted

Cause:

The disk sector being addressed is not on the disk or the disk platter is not mounted. (Maximum Legal sector address depends upon the model of disk used.)

Recovery:

Correct the program statement in error, or mount a platter in the specified drive.

ERR I99

Error:

Read After Write Error

Cause:

The comparison of read after write to a disk sector failed, indicating that the information was not written properly. This error usually indicates a bad disk platter.

Recovery:

Write the information again. If error persists, try a new platter; if error still persists, call your Wang Service Representative.

APPENDIX D

SCHEMATICS

This appendix contains all of the pertinent schematics relating to the 2280 DPU. These are listed below as follows:

<u>WL Number</u>	<u>Nomenclature</u>
210-7415	Prime Circuit Board
210-7416	Motherboard
210-7421	ALU/MUX Interface Board
210-7422	ECC/Device Interface Board
210-7423	RAM/PROM Control Board
210-7424	I/O Controller Board
210-7715	2280 MUX Disk Controller
210-7716	Motherboard
210-7717	2280 MUX Master
210-7718	2280 MUX Slave
210-L567	Regulator Board
