

## MICROPROCESSOR CONTROL

Control of the Alto microprocessor is shared among 16 "tasks" arranged in a priority order. The tasks are numbered 0 to 15; 0 is the lowest priority and 15 is the highest. The lowest priority task is the emulator task which fetches instructions and executes them.

### BRANCHING

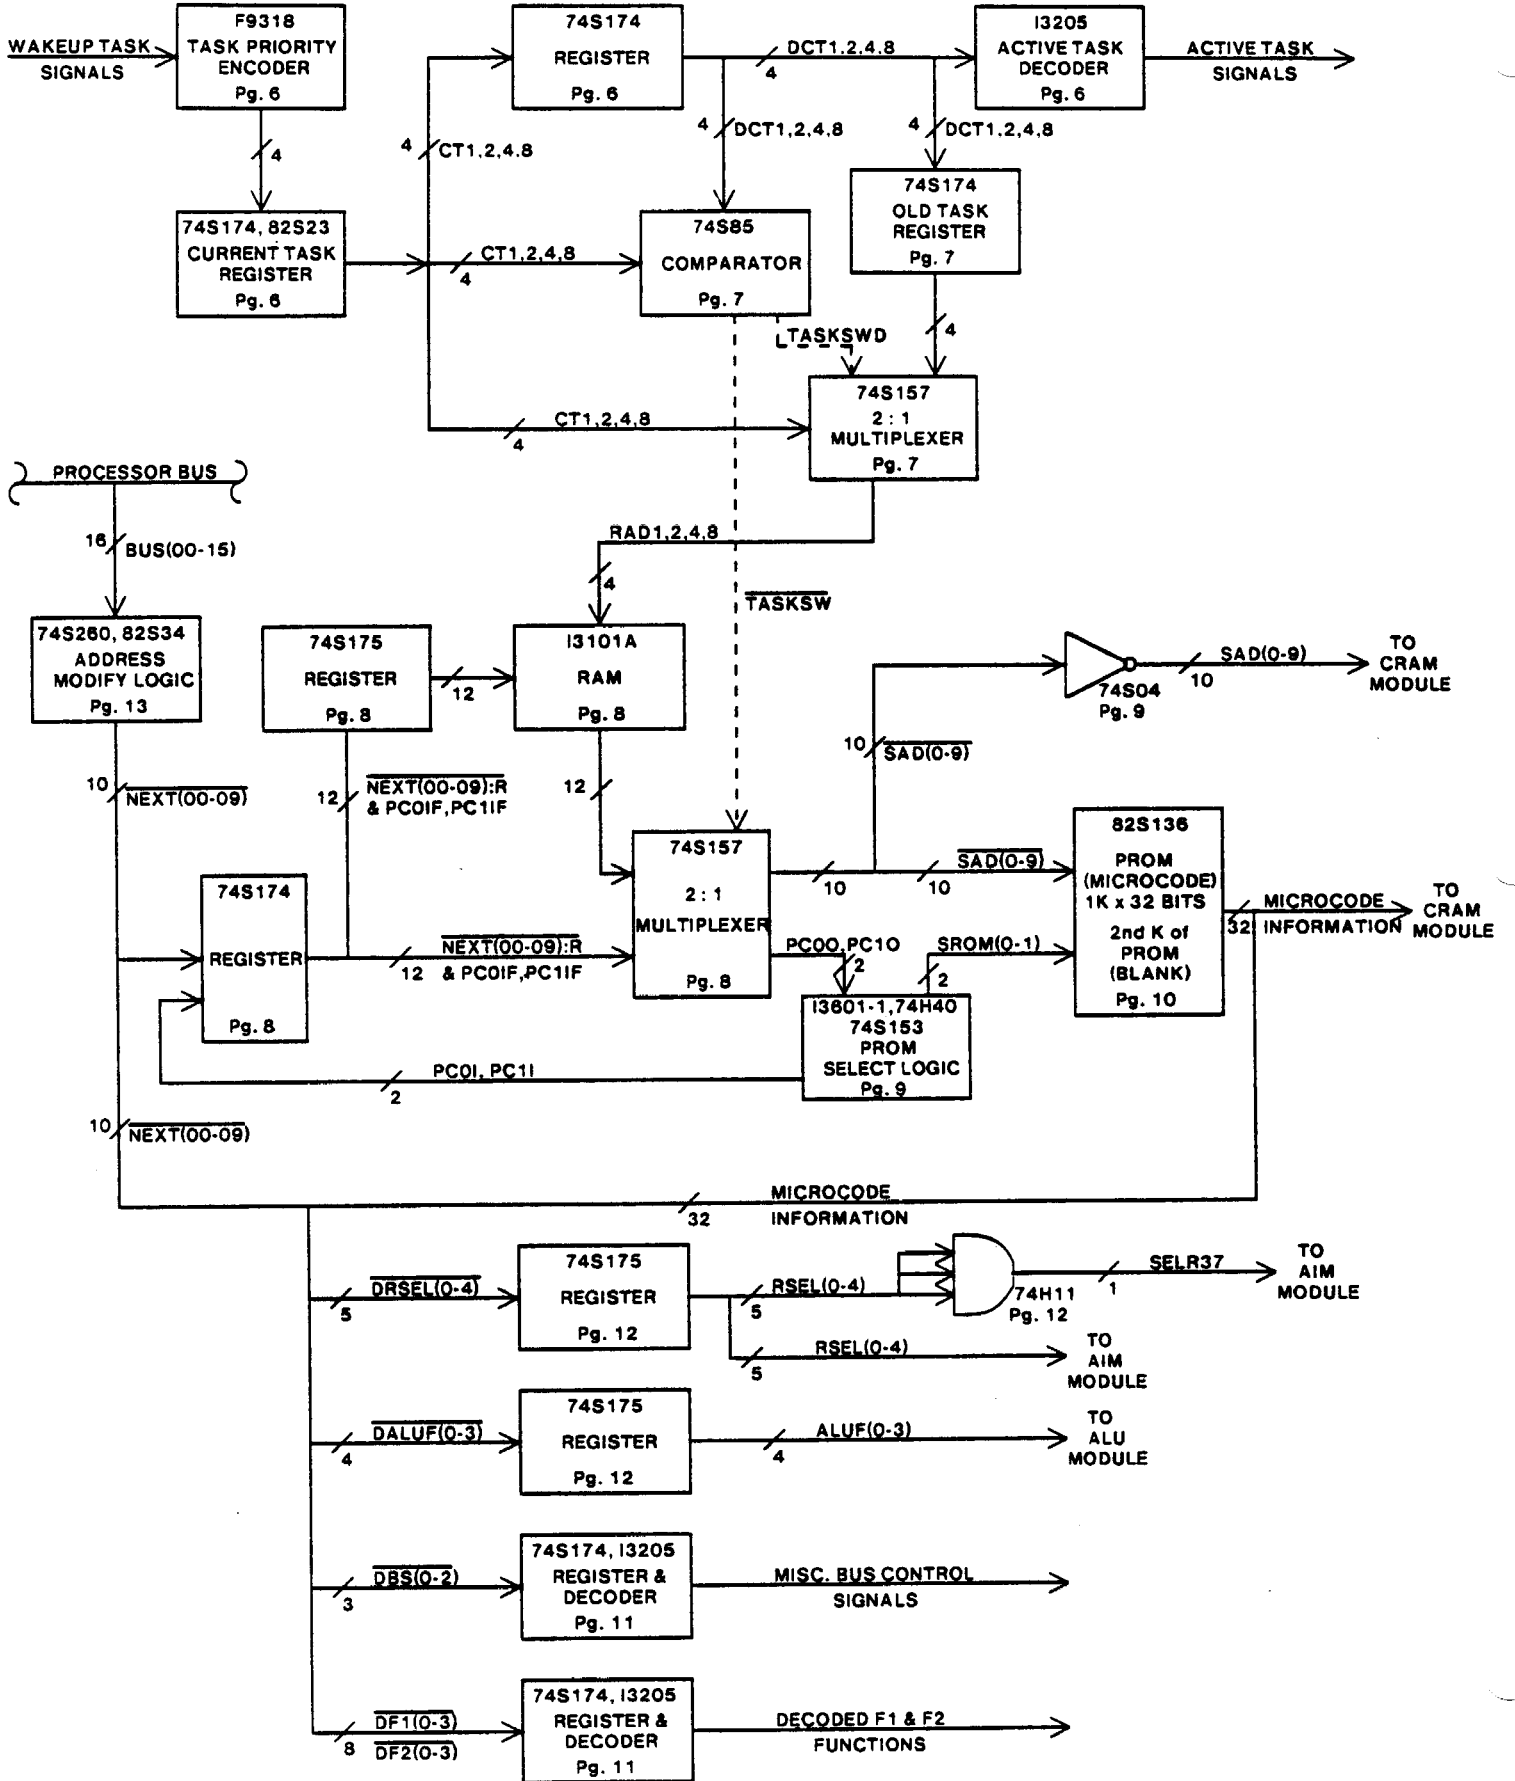

The microprocessor offers a limited branching capability which, although somewhat cumbersome, has proven adequate for chores undertaken by Alto microcode. The basic idea is that special microprocessor functions may modify the NEXT field, and consequently, alter the flow of control. Modification is accomplished by ORing various bits into the NEXT field.

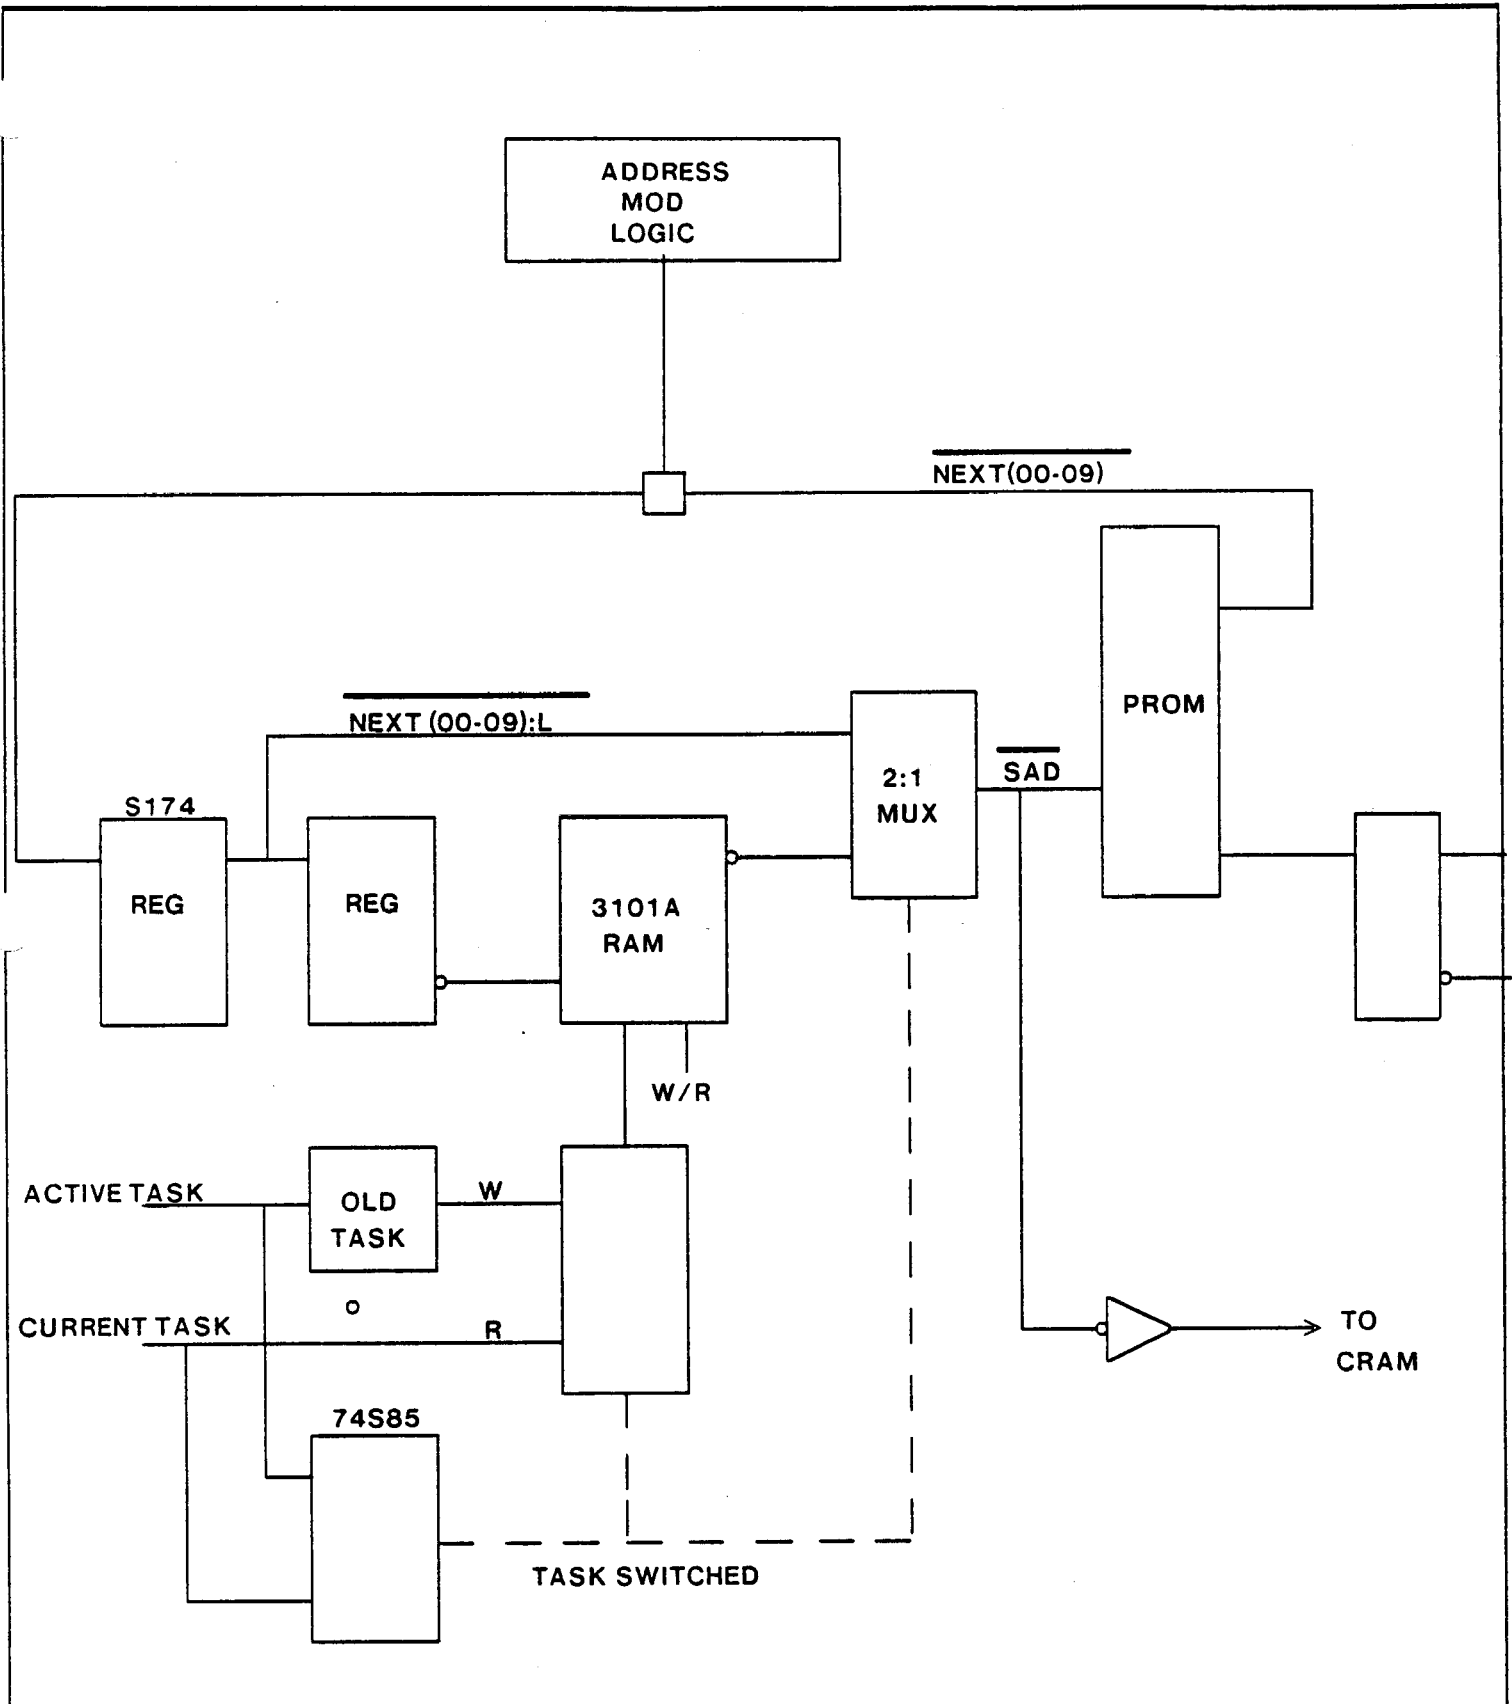

### TASK SWITCHING

Only one of the 16 tasks is executing microinstructions at any one time. Once a task begins execution, it continues to execute until it invokes a task switch function that enables switching to another task.

A task is considered eligible for execution if its hardware-generated "wakeup signal" is asserted (these signals are not accessible to the microprogram). The wakeup signals enter a priority encoder that calculated the number of the highest-priority eligible task. When a running task invokes a task switch, control will switch to another task only if a higher priority task has a wakeup signal held true, or if the current task no longer has a wakeup signal true. In the latter case, control goes to a lower priority task. The lowest priority task is the CPU emulator, which is always requesting wakeup.

**PROGRAMMING THE PROMS:**

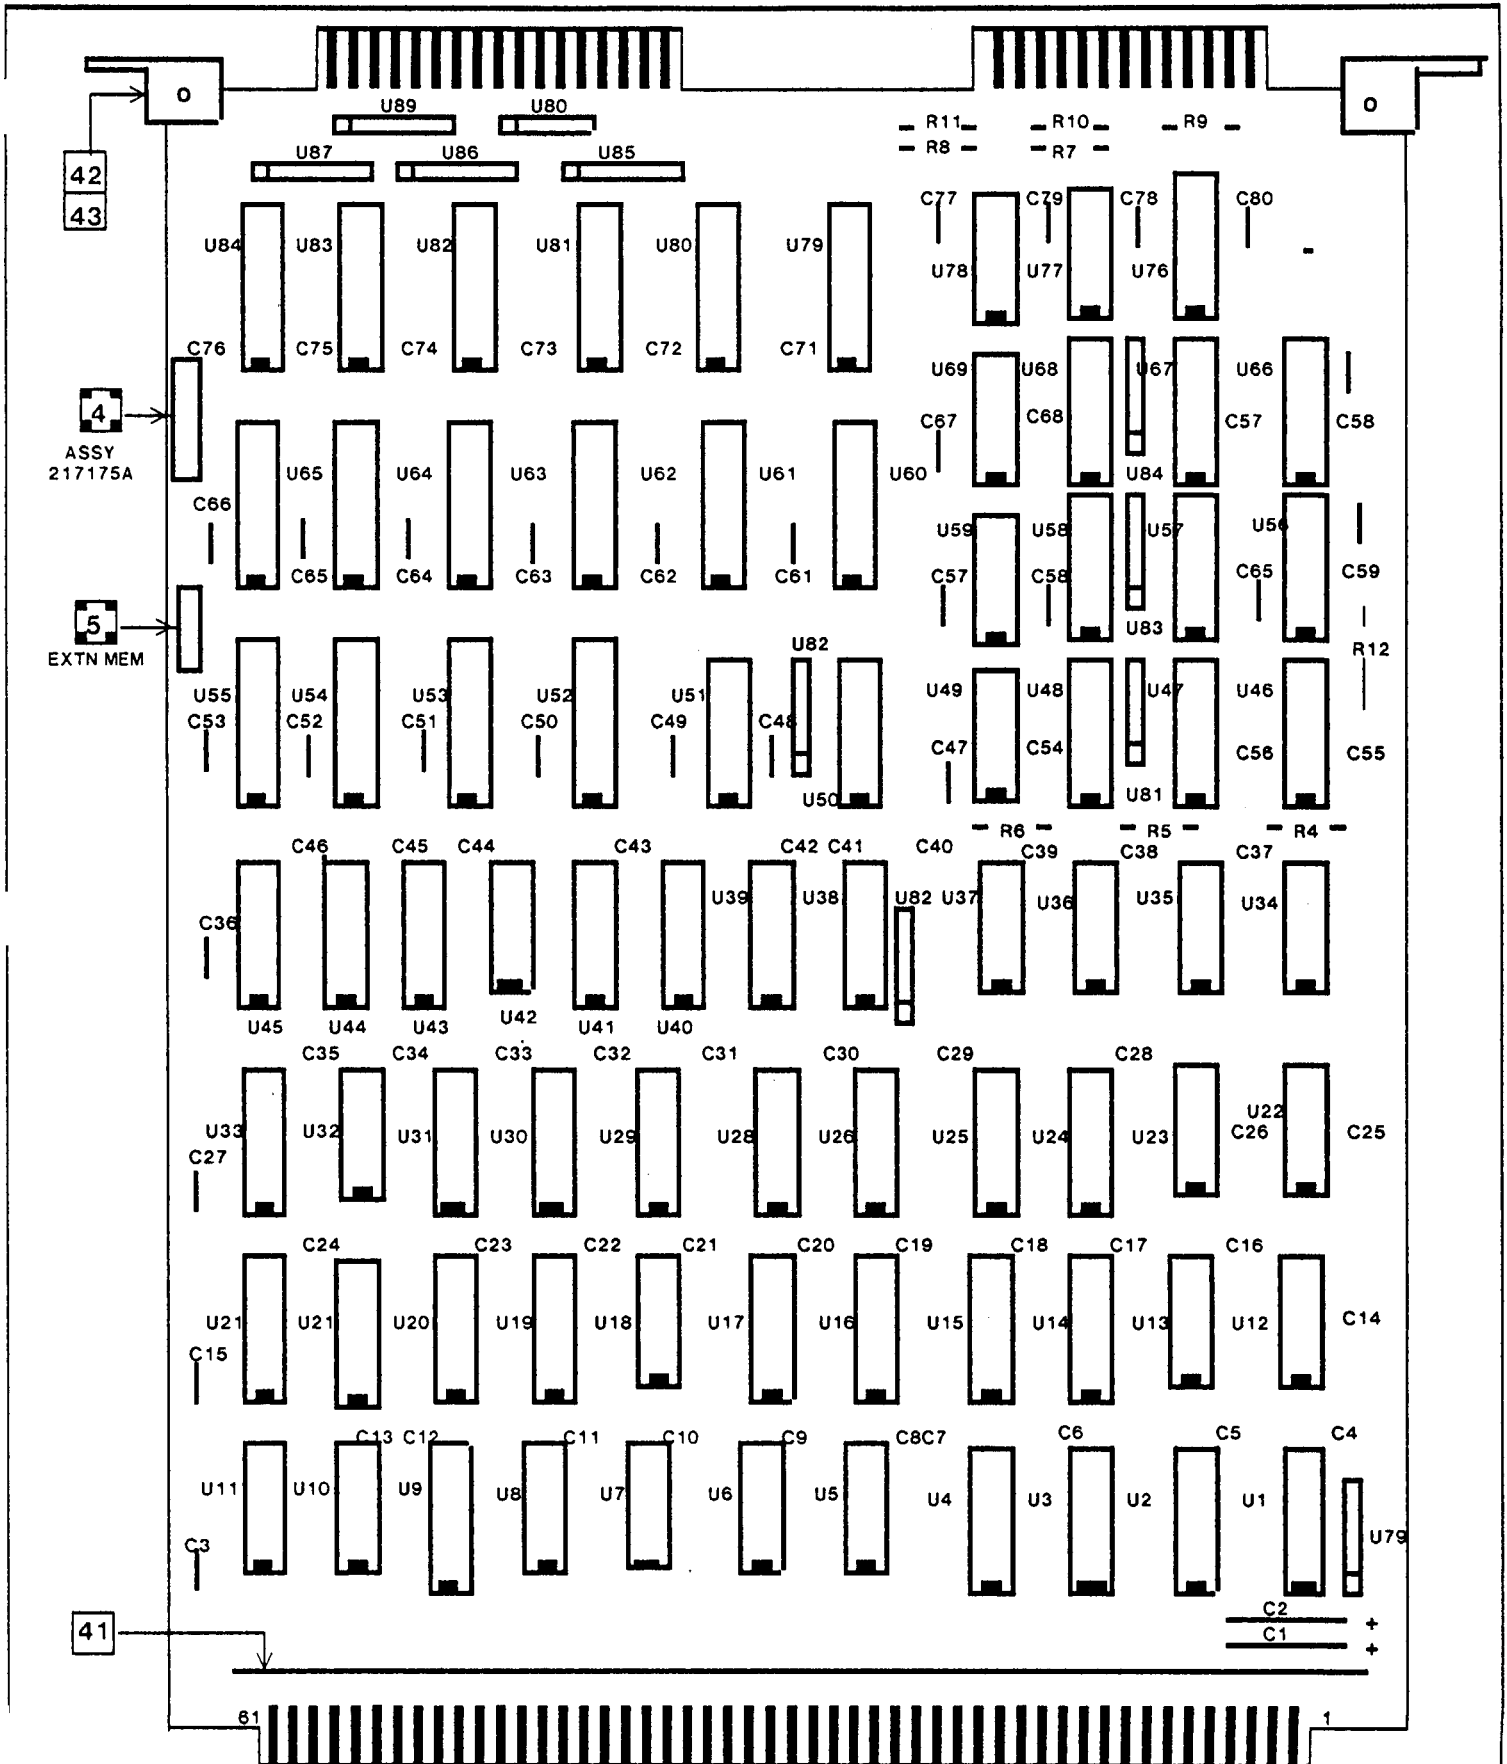

- A. PROGRAM THE PROMS BEFORE IT IS INSERTED INTO THE MODULE.
- B. LABEL EACH PROM AS DEFINED AS SHOWN BELOW USING AVERY SELF-ADHESIVE (1/16X1/2) LABEL. STICK THE LABEL ON THE TOP OF THE PROM(IC).
- C. PROGRAM THE FOLLOWING PROMS:

PROM LABEL	LOCATION	FILE NAME	FILE LOCATION
