# TABLE OF CONTENTS

<b>1. Release Summary</b>	<b>1-1</b>
1.0 Changes from XDE 4.0	1-1
1.1 XDE Desktop	1-2
1.2 XDE Mesa Development Tools	1-4
1.3 XDE C Development Tools	1-6
1.4 XDE Xerox ViewPoint 1.1 Programming Package	1-7
1.5 XDE Project Management Services and Tools	1-9
1.6 XDE Mesa Utilities and Prototypes	1-10
1.7 XDE Mesa Course	1-10
1.8 Viewpoint Programming Course	1-10
<b>2. Installing XDE Software</b>	<b>2-1</b>
Procedure 1: Setting the time on a workstation	2-2
Procedure 2: Choosing the software installation method	2-3
Manually installing XDE - Command Mode	2-4
Procedure 3: Partitioning the disk	2-4
Selecting a partitioning script	2-5
Information on Interlisp	2-6
Procedure 4: Installing and initializing the software	2-6
Option 5: Installing XDE Boot Files only	2-7
Option 6: Installing XDE User.cm, Basic Tools, and Tutorials	2-8
Option 7: Initializing the 8010 workstation with XDE but not ViewPoint	2-9
Option 8: Initializing the 8010 workstation with XDE and ViewPoint	2-9
Option 9: Returning to MAIN MENU	2-10
Procedure 5: Preparing to install from the network	2-10
Procedure 6: Copying XDE from a workstation to the network	2-11
Creating the temporary directory	2-11
Reading the XDE files from the floppies to the workstation	2-12
Logging on to the system	2-12
Storing the XDE files on the file server	2-13
Deleting the temporary directory and files	2-13
Sword script	2-14
Procedure 7: Retrieving XDE software from the network	2-14

<b>3. Notes and Cautions</b>	<b>3-1</b>
3.1 Pilot 12.3 problems and restrictions	3-1
3.2 ViewPoint Programming Package problems and restrictions	3-2
3.3 Mesa 12.3 problems and restrictions	3-4
3.4 C Environment problems and restrictions	3-5
3.5 TCP/IP problems and restrictions	3-7
<b>Appendix A: Directory Listings</b>	<b>A-1</b>
<b>Quick Reference Installation Guide</b>

# 1. **RELEASE SUMMARY**

---

This section provides a list of the products included in the XDE 5.0 release and a description of the components of each product. Further information on XDE and its components can be found in the *XDE Product Overview*.

XDE 5.0 incorporates Mesa 12.3, Pilot 12.3, Services 8.0 workstation interfaces, and is compatible with the ViewPoint 1.1 environment. The major new features in XDE 5.0 are the C Development Tools, ViewPoint Document interfaces, and TCP/IP protocols and tools. The remainder of XDE 5.0 is a maintenance release.

---

## 1.0 **Changes from XDE 4.0**

---

**XDE Desktop** There are new tools for TCP/IP-based file transfer, mail, and virtual terminal emulation. A separately loaded module provides TCP/IP protocol implementations.

Bugs have been fixed in: Adobe, Chat, Compiler, FTP, Install, MailTool, MFileServer, MakeDLionBootFloppyTool, and MakeDoveBootFloppyTool. The FileWindow Load/Reset/Empty user interface is slightly different. The Find tool will now match up to 65,536 characters.

Pilot 12.3 includes client-side map-logging. World-swap debugging of bootfiles built with Pilot 12.3 must be done by a Pilot 12.3 debugger. (ViewPoint 1.1 bootfiles are built with Pilot 12.2).

Bootfiles, microcode, and germ files have been updated. An improved heap implementation, SOSP83Heap, is now the default Heap in Tajo and CoPilot bootfiles.

**XDE Mesa Development Tools** The public programming interfaces that were part of XDE 4.0 for interfacing to XDE, Pilot, and Services remain unchanged.

TCP/IP protocol interfaces are new, and allow XDE applications to use TCP/IP protocols on the Ethernet. Interfaces to Services remain at Services 8.0, compatible with Services 9.0 and 10.0.

A new debugger, Sword, allows you to debug programs without doing a world-swap.

<b>XDE C Development Tools</b>	This product is new for XDE 5.0. Its primary purpose is to port programs written in the C language to run in XDE or ViewPoint. C and Mesa programs may call one another.
<b>XDE Xerox ViewPoint 1.1 Programming Package</b>	This package includes interfaces compatible with Xerox ViewPoint 1.1. Previous Xerox ViewPoint 1.0 public interfaces remain unchanged. ViewPoint 1.1 document interfaces, which permit an application to read and write ViewPoint documents, are new.
<b>XDE Project Management Services and Tools</b>	Bugs have been fixed in the Adobe and Librarian tools and the Adobe Service. Adobe and Librarian Services have been updated to Services 10.0.
<b>XDE Mesa Utilities and Prototypes</b>	Several additional tools for XDE and ViewPoint have been added.
<b>ViewPoint Programming Course</b>	New for XDE 5.0, this course is a self-paced tutorial in developing ViewPoint applications.

---

## 1.1 XDE Desktop

---

The XDE Desktop provides the desktop environment and a general tool set. System development tools as well as non-programming tools (such as Typefounder) run on the XDE Desktop. The tool set includes file management, text management, and virtual terminal tools. The XDE Desktop is a prerequisite for the remaining XDE products.

The *XDE User Guide* provides documentation for the tools in the XDE Desktop. *Concepts and Principles* provides an introduction to the XDE user interface, communications with Network Services, Mesa and Pilot. The *XDE Tutorials* is an online introduction to the XDE user interface, files, text, mail, printing, booting, and programming tools,

The XDE Tools built into the CoPilot and Tajo boot files are:

<b>DictionaryTool</b>	allows you to expand abbreviations according to a user-defined dictionary and to add abbreviation-expansion pairs to that dictionary.
<b>Executive</b>	allows you to run and load Mesa programs. It has a standard set of programs already loaded and available. The Executive uses a simple teletype interface.
<b>FileTool</b>	allows you to retrieve, delete, list, rename, and copy files on the local disk or on remote file servers. The FileTool has a tool interface.
<b>FileWindow</b>	allows you to create, view, and edit text files.
<b>Floppy</b>	allows you to store and retrieve files on floppy disks using your workstation floppy disk drive.

---

<b>HeraldWindow</b>	displays the name and version of the boot file, the date on which it was built, the current time and date, the name of the current volume, and the number of free pages on that volume.
<b>ProfileTool</b>	allows you to edit global information used by other tools running in the development environment, such as log-in names and passwords.
<b>SearchPathTool</b>	allows you to inspect and change the file-system search path.
<b>CoPilot</b>	supports both source-level and remote debugging. It allows you to set breakpoints, trace program execution, display the runtime state, and interpret Mesa statements. CoPilot is built into the CoPilot boot file only.

The following tools are separately loaded:

The user interface tools for TCP/IP allow an XDE Desktop user to communicate from a workstation to another device on the Ethernet in order to perform mailing, filing, virtual terminal, and remote login functions. If the other device on the Ethernet is an Arpanet host, the XDE user will be able to communicate with the Arpanet. The tools are:

<b>ArpaChat</b>	provides a TTY window interface to a remote host's telnet processes.
<b>ArpaFileServer</b>	provides a window or command line interface for the ARPA file server.
<b>ArpaFileTool</b>	provides a window interface much like the XDE FileTool, which allows you to retrieve, store, list, and so on, on an ARPA file server.
<b>ArpaMailTool</b>	provides a window interface much like the XNS-based XDE MailTool. You to send and receive mail with it.
<b>ArpaRemoteExec</b>	provides an executive to remote users who connect to the local workstation using the Telnet protocol.
<b>Brownie</b>	is useful for transferring files among remote directories.
<b>Chat</b>	is a tool for TTY and VT100 emulation.
<b>Compare</b>	examines a pair of text files and summarizes the differences between them.
<b>DMT</b>	allows you to display a changing screen image when your workstation is not in use (since a constant image displayed for a long period damages the screen).
<b>Find</b>	allows you to search for patterns in text files.
<b>FTP</b>	is a file transfer program that runs in the Executive and allows you to move files into or out of a file system located on a file server or another workstation. Unlike FileTool, FTP does not have a tool interface.

<b>MailFileScavenger</b>	is a tool used to save a damaged mail file by restoring the internal structure of the file to a consistent state.
<b>MailTool</b>	provides an interface between your workstation and network-based electronic mail facilities. MailTool lets you send, receive, forward, categorize, and answer electronic mail.
<b>Maintain</b>	is an NS-based interface to the Clearinghouse database. It allows you to inspect and modify database information concerning message system users, distribution lists, servers, and services.
<b>MFileServer</b>	allows a workstation to use FTP to transfer files to another workstation.
<b>NSTerminal</b>	allows terminal emulation in an XDE window, using either a Communications Interface Unit (CIU) or an External Communications Service (ECS).
<b>Print</b>	allows you to generate interpress format files and send them to a network printer.
<b>RemoteExec</b>	allows you to access the Executive window of a remote workstation from your local workstation.
<b>ToolDriver</b>	provides a mechanism that drives tools to perform repetitive, routine tasks automatically in batch mode.

---

## 1.2 XDE Mesa Development Tools

---

The XDE Mesa Development Tools allow you to create, debug, and manage applications written in the Mesa language. The product includes tools for application development and management, as well as Mesa interfaces to XDE, Pilot, TCP/IP protocols, and Xerox Network Services. The XDE Desktop is a prerequisite for the XDE Mesa Development Tools.

The *XDE User Guide* explains the development tools, and the *Mesa Language Manual* covers the Mesa programming language. The Mesa interfaces are described in the *Mesa Programmer's Manual*, the *Pilot Programmer's Manual*, and the *Services Programmer's Guide*.

The development tools are:

<b>Ben</b>	produces a list of page faults that occurred during a specified interval of client activity. The list tells you why each fault occurred.
<b>Binder</b>	allows you to combine modules and previously bound configurations to produce a new, loadable configuration. The output of the binder is a binary configuration description (an object file) that can be loaded into a running system or can, in turn, be processed by the binder.
<b>CommandCentral</b>	allows you to compile and bind programs on a development volume and run them on a client volume.

---

<b>Compiler</b>	translates Mesa source files into corresponding object files. An object file contains the executable code for the module, tables for use by the binder and loader, and symbols for use by the debugger.
<b>CountPackage</b>	gathers information on the flow of control between groups of modules.
<b>DebugHeap</b>	is a debugging aid that displays the memory layout and finds storage leaks.
<b>ExampleTool</b>	provides a model for tool writing, including examples of most tool capabilities.
<b>Formatter</b>	converts Mesa source files into a standard format. It establishes the horizontal and vertical spacing of the program text so as to reflect the logical structure.
<b>IncludeChecker</b>	allows you to examine a collection of local or remote source and object files for consistency. It produces an output listing that gives a compile and bind order for the files, lists the dependencies among the files, and generates compile and bind commands that correct any inconsistencies.
<b>Lister</b>	produces listings of information in object files, such as definition file dates and cross-reference listings of procedure calls within the object file.
<b>Packager</b>	allows you to explicitly group procedures together into swap units to improve virtual memory performance.
<b>PerfPackage</b>	allows you to collect timing and frequency statistics for program execution.
<b>PGS</b>	takes a context-free grammar specified in Backus-Naur form and tests whether it is LALR(1). If so, it produces compacted binary tables that can be used with the Mesa Parser.
<b>Spy</b>	measures the amount of time spent executing in a module, set of procedures, or source statements. Spy identifies the most frequently executed modules or the most frequently executed procedures within a module.
<b>Statistics</b>	gathers statistics about Mesa source and object files (such as number of characters, frame size).
<b>Sword</b>	contains all the functions of the built-in CoPilot debugger, but permits you to debug programs on the same logical volume, eliminating a time-consuming world-swap.
<b>Table Compiler</b>	creates files in the format of Mesa object files. This allows you to bind information other than programs, such as fonts or microcode files, into a Mesa configuration.

Mesa public interfaces to XDE, Pilot, and Services are used by programs written in Mesa or in the C language. (The XDE C Language Development Tools are required to write applications in C). The following interface definitions are included:

<b>Mesa 12.3 public interfaces</b>	provide Mesa interfaces into the XDE runtime environment.
<b>Mesa source code</b>	for the following tools: ExampleTool, FileTool, Print, and ToolDriver. This source code is intended to serve as examples for developing custom XDE-based tools.
<b>Pilot 12.3 public Interfaces</b>	provide Mesa interfaces for the Pilot operating system, for use by programs running in either XDE or ViewPoint.
<b>Services 8.0 config modules</b>	are separately loaded modules which implement those public Services workstation interfaces that are not implemented in the bootfile. The config modules provide the following functions: Authentication, Clearinghouse, Remote Filing, Mailing, Printing, Gateway Access Protocol, Phonetnet, Remote Workstation, and Common Software.
<b>Services 8.0 public Interfaces</b>	provide Mesa interfaces to Xerox Network Services, including Print, File, Mail, External Communication, Clearinghouse, and Internetwork Routing Services. These interfaces are built on Courier.
<b>TCP/IP public interfaces</b>	provide Mesa interfaces for applications running in XDE to use the following TCP/IP protocols: TCP, IP, FTP, TFTP, ICMP, ARP, SMTP, and Telnet.

---

## 1.3 XDE C Development Tools

---

The XDE C Development Tools allow you to develop applications written in the C language to run in either XDE or ViewPoint. The primary purpose of this product is to allow a software developer to port programs which are written in C from another environment to XDE or to ViewPoint. The C compiler and library are ported from UNIX 4.2 bsd. (UNIX is a Trademark of Bell Laboratories.)

Programs written in C and Mesa can call one other, and C programs can make use of interfaces to XDE, Pilot, Services, and ViewPoint. C programs can run in the *C Tool* window in XDE or ViewPoint in order to preserve the familiar TTY user interface. Alternatively, C programs can be modified to adopt the user interface style of XDE or ViewPoint. Source level debugging is provided for C and Mesa programs by the CoPilot debugger, included in the XDE Desktop.

The XDE Desktop and the XDE Mesa Development Tools are prerequisites for the XDE C Development Tools. The XDE ViewPoint 1.1 Programming Package is also a prerequisite for writing ViewPoint applications that do not run in the CTool in ViewPoint. The XDE C Development Tools are documented in the *C Reference Guide*.

The XDE C Development Tools includes the programming tools specific to C such as the C compiler tools, as well as general utilities such as the Linker, Assembler, the runtime environment, and the C library. The product includes the following components:

<b>Assembler</b>	creates an object file from an assembly language source file. The object file may be linked with other object files with the Linker.
<b>BWS C environment</b>	runs in ViewPoint, and includes the C Tool, the C library and runtime support for C programs running in ViewPoint.
<b>C Environment</b>	runs in XDE and includes the C Tool, the C library and runtime support for C programs running in XDE.
<b>C library</b>	implements the standard C library functions commonly used by C programs.
<b>C Tool</b>	provides a sub-environment within ViewPoint or XDE to C programs which follow the common program paradigm of most C programming environments. Using this sub-environment reduces the amount of work necessary to port C programs to XDE or ViewPoint. A script facility is included.
<b>Compiler tools</b>	run in the C Tool in XDE or ViewPoint, and include a compiler driver program <code>cc</code> , which invokes the C preprocessor, C Compiler, Assembler, and Linker. C programs are compiled in the C Tool using <code>cc</code> .
<b>Linker</b>	creates an executable module from a collection of separately compiled modules, which may include programs written in C, Mesa, and assembler.
<b>ViewPoint Veneer</b>	includes C function versions of commonly used ViewPoint interfaces to simplify the task of writing ViewPoint applications in C. The interfaces correspond to the following ViewPoint interfaces: Atom, Containee, Display, FormWindow, Heap, MenuData, NSFile, PropertySheet, SelectionSimpleTextDisplay, StarWindowShell, Window, XString

---

## 1.4 XDE Xerox ViewPoint 1.1 Programming Package

---

The XDE Xerox ViewPoint 1.1 Programming Package includes tools, interfaces, and data files that allow you to develop custom applications for ViewPoint. You can write your applications in Mesa with the XDE Mesa Development Tools, or in C with the XDE C Development Tools. The XDE Desktop, XDE Mesa Development Tools, and ViewPoint 1.1 are prerequisites for this product.

The *ViewPoint Programming Tools Guide* documents the tools in this package, and the *ViewPoint Programmer's Manual* documents the ViewPoint interfaces. The XDE Mesa Development Tools provides the Mesa interfaces to Pilot and Services that are also used to develop ViewPoint applications.

The Package includes the following tools:

<b>Applize</b>	allows you to create an application from various raw components.
<b>BitmapEditor</b>	allows you to edit bitmaps and to draw "freehand" with the mouse.
<b>IconEditor</b>	allows you to create icons or to change an icon file name or the properties of the icon.
<b>KeyboardTool</b>	allows you to build and maintain ViewPoint keyboard data files, to examine a keyboard file, change the existing entries, and add new entries.
<b>MessageFileCreate</b>	allows application integrators to create Message Master files from the compiled message object files.
<b>MessageFileTool</b>	allows merging of current and previous versions of a file, translation, editing, printing, and displaying of file contents, translation validity checking and comparison.
<b>RuntimeFileCreate</b>	allows application integrators to create original text runtime message files.
<b>System Folder</b>	allows you to look at the contents of a desktop.
<b>ViewPoint 1.1 interfaces</b>	provide Mesa interfaces to allow custom ViewPoint applications to use the ViewPoint environment:
Basic Windows:	Context, Cursor, Window, Display
Containers:	ContainerCache, ContainerSource, ContainerWindow, FileContainerShell, FileContainerSource
Customization:	IdleControl, OptionFile
Documents:	DocInterchangeDefs, DocFramePropsDefs, DocPagePropsDefs, FieldPropsDefs, FontPropsDefs, GraphicsInterchangeDefs, InstanceDefs, ParaPropsDefs, TableInterchangeDefs, TableSelectionDefs
Desktop:	Containee, Directory, Divider, StarDesktop
Environment:	AtomicProfile, BWSZone, Event, Selection, Undo, UnitConversion
Forms:	FormWindow, FormWindowMessageParse, PropertySheet
Keyboards:	BlackKeys, KeyboardKey, KeyboardWindow, SoftKeys
Menus:	MenuData, PopUpMenu
Messages:	XString, XTime, XToken
Message Posting:	Attention, MessageWindow, XComSoftMessage, XMessage
NSFile:	ApplicationFolder, BWSAttributeTypes, BWSFileTypes, Prototype, Catalog
Real Numbers:	XLReal
Text:	SimpleTextEdit, SimpleTextFont
User Input:	TIP, TIPStar, Atom, LevelIVKeys
Window Shells:	StarWindowShell

Xerox Character Code Sets: XChar, XCharSet, XCharSet41, XCharSet42, XCharSet43, XCharSet44, XCharSet45, XCharSet46, XCharSet47, XCharSet164, XCharSet356, XCharSet357

**ViewPoint 1.1 document interfaces** are Mesa interfaces that support reading the contents of a ViewPoint document, creating a new document, and appending new data to the end of a document. The interfaces are compatible with ViewPoint 1.1. The interfaces are:

**DocInterchange** to enumerate objects in a document, read the contents of objects, create new documents, and append new objects to a document. Objects include text paragraphs, table frames, graphics frames, format characters, fields, and page breaks, but not Equations. This interface does not support inserting, changing, or deleting objects in-place in an existing document.

**GraphicsInterchange** to enumerate, read the contents, and create anchored graphics frames .

**TableInterchange** to read the contents, append rows, and create a new table.

---

## 1.5 XDE Project Management Services and Tools

---

XDE Project Management Services and Tools provide network-based facilities that help manage system development. Where the Mesa Development Tools support building individual programs, the Project Management Services support large-scale programming. The XDE Desktop is a prerequisite for the Project Management Tools. Services Standard Software is a prerequisite for the Adobe and Librarian Services, which run on a server. The Adobe and Librarian Services in XDE 5.0 are Services 10.0 compatible and require a Services 10.0 bootfile.

The *Project Management Tools User Manual* and the *Project Management Services System Administrator's Guide* document this product. Basic system administrator documentation for Network Services is provided by the *System Administration Library*, which is not included with this product.

The Project Management Services and Tools include:

**Adobe Tools and Service** provide distributed database management facilities for use in project management.

**Librarian Tools and Service** ensure exclusive access, use, and removal of files stored in network file servers.

## 1.6 XDE Mesa Utilities and Prototypes

---

XDE Mesa Utilities and Prototypes is a user's library consisting of a variety of applications, including utilities, application prototypes, and games. XDE applications, as well as ViewPoint applications, are included.

This product only has online documentation and is not supported by Xerox. The XDE Desktop is a prerequisite for the XDE Mesa Utilities and Prototypes.

---

## 1.7 XDE Mesa Course

---

The XDE Mesa Course is a self-paced, on-line Mesa language programming tutorial, completed at a workstation at the customer site. It introduces basic Mesa programming skills, concepts, and interfaces, covering the range of programming skills required for application and system development in XDE.

The course consists of a manual and programming exercises. Each chapter has examples and exercises to provide hands-on experience with the concepts introduced. The Mesa Language Course, conducted by the Systems Applications Training Group, is a training prerequisite for the XDE Mesa Course.

The XDE Desktop and the XDE Mesa Development Tools are software prerequisites for the XDE Mesa Course. The XDE Mesa Course can be completed within 3 to 8 weeks.

---

## 1.8 ViewPoint Programming Course

---

The XDE ViewPoint Programming Course is a self-paced programming tutorial, completed at a workstation on the customer site. The course demonstrates and exercises the range of programming skills required for development of sophisticated ViewPoint applications.

You must be a reasonably experienced Mesa programmer. The course can be completed within 3 to 8 weeks. The XDE Desktop, XDE Mesa Development Tools, ViewPoint Programming Package, and ViewPoint 1.1 are software prerequisites for this course.

The *ViewPoint Course Manual* covers the following material:

- ViewPoint User Interface
- Strings and Messages (XString, XFormat, XMessage)
- Simple Applications
- Context
- Display (Display and SimpleTextDisplay interfaces)
- Form Windows
- Property Sheets
- TIP
- NSFiling Attributes

- NSFiling (Open, close, create, delete, etc.)
- Streams
- NSSegmentSelection (requestors only)
- Icon applications
- Application folders
- Running a ViewPoint application
- Using the Icon Editor
- Using the Message tools

## **2. INSTALLING XDE SOFTWARE**

The Xerox Development Environment (XDE) is installed on two logical volumes of the local disk: Tajo and CoPilot. Tajo is the volume used for testing and running XDE applications. CoPilot is the volume used for developing and debugging applications. However, you can reconfigure the physical disk to add other logical volumes (for example, CoCoPilot). CoCoPilot is the volume used for the debugging and recovery of CoPilot.

There are two ways to install XDE:

- load the software from floppy disks, or
- retrieve it online from a file server.

To install the software from floppy disks, you must first partition the disk, then install the software, and then initialize the software. The installation kit consists of six diskettes:

1. XDE 5.0 Installer
2. XDEBoot1
3. XDEBoot2
4. XDEBoot3
5. XDE Basic Tools
6. XDE Tutorials

Installation procedures 1 through 4 step you through installing the XDE software from floppies to one workstation.

Once the software is on one workstation in a network, you can install XDE to the other workstations from a file server. To install from a file server you first load XDE from the workstation to a network file server (procedures 5 and 6). Then you retrieve XDE from the file server to the remaining workstations (procedure 7).

All the installation procedures are described in this section.

## Procedure 1: Setting the time on a workstation

If you're using an isolated workstation, or if the Clearinghouse service is not operating, you must set the time before installing XDE.

To set the time:

1. Insert the disk labeled **XDE 5.0 Installer** into the floppy disk drive of the 8010 workstation.
2. Do a Boot 2:
  - a. Simultaneously press the **B RESET** button and the **ALT B** button.
  - b. Release the **B RESET** button, wait until **0002** appears on the workstation maintenance panel, then release the **ALT B** button.

The Installer herald now appears on the screen.

**Note:** If the workstation is on a network with an operational Clearinghouse, omit the remaining steps in this procedure and go to "Procedure 2: Choosing the software installation method."

3. For workstations that are **NOT** on a network or that do **NOT** have an operational Clearinghouse, perform the following steps to set the date and time.

About one minute after doing the Boot 2, the XDE Installer disk asks for the date and time. Refer to the example below and Figure 2-1:

<u>Screen displays:</u>	<u>You Enter</u>	<u>Comments</u>
a. Locating Time Server...Time is not set.		
b. Time zone offset from (for example) Greenwich [-12..12]:	-8<return>	Enter: -8 - Pacific time -7 - Mountain time -6 - Central time -5 - Eastern time
c. Minute offset [0..59]:	0<return>	
d. First day of Daylight Savings Time [0..366]	121<return>	
e. Last day of Daylight Savings Time [0..366]	305<return>	
f. Please Enter the date and 24 hour time in form MM/DD/YY HH:MM:SS		
g. Time:	06/05/86 15:35:00<return>	

- h. Set time to 5-Jun-86 15:35:00
- i. Okay?: y<return>

```

installer Version 1.0

Processor = 0AA00437BH = 25200041573B
Memory size 768K bytes

Locating Time Server... Time is not set
Time zone offset from Greenwich [-12..12]:-8<return>
Minute offset [0..59]: 0<return>
First day of DST [0..366]: 121<return>
Last day of DST [0..366]: 305<return>
Please Enter the date and 24 hour time in form
MM/DD/YY HH:MM:SS
Time: 06/05/86 15:35:00<return>
Set Time to 5-Jun-86 15:35:00
Okay?: yes<return>

```

---

## Procedure 2: Choosing the software installation method

---

The floppy disk labeled XDE 5.0 Installer contains the Main Menu. From this menu you select the script programs for partitioning the 42 MB disk and for installing and initializing the software.

The Main Menu shown in Figure 2-2 appears once the date and time are set.

```

MAIN MENU:
  1  XDE 5.0 Installation

Enter choice number, then press RETURN: 1

```

To proceed from the Main Menu:

1. Enter 1 and press <return>.
2. The screen now displays the Partitioning and Installation menu that contains selections to partition the 42 MB disk, install the software, and initialize the workstation. See Procedures 3 and 4 for more information.

**Note:** If you want to install the software manually, and are qualified to do so, don't press <return> for this step. See "Manually installing XDE - Command Mode" below.

---

## Manually installing XDE - Command Mode

---

**WARNING:** In Command Mode you can modify the physical and logical volumes. You risk destroying their present contents.

Once in Command Mode, you proceed at your own risk. You should only enter Command Mode if you are qualified to proceed without further online guidance. If not, proceed to "Procedure 3: Partitioning the disk."

To enter Command Mode from the Main Menu:

1. Enter **911** as the choice number and press **<return>**.
2. The system displays a message asking you to enter a password. Enter the password:

**laccepttherisk**

(Don't enter spaces between words in this password) and press **<return>**.

---

## Procedure 3: Partitioning the disk

---

Before you can install the software, you must partition the physical disk into logical volumes. The partitioning script you select depends on the software you install. Figure 2-3 shows the four schemes on the Partitioning and Installation menu, choices 1 through 4.

Choices available:

- 1 Partition 42 MB disk into 2 volumes for XDE only
- 2 Partition 42 MB disk into 4 volumes: 2 for XDE and 2 for ViewPoint
- 3 Partition 42 MB disk into 4 volumes: 2 for XDE and 2 for Interlisp
- 4 Partition 42 MB disk into 6 volumes: 2 each for XDE, ViewPoint, and Interlisp
- 5 Install XDE Boot Files only
- 6 Install XDE User.cm, Basic Tools, and Tutorials
- 7 Initialize 8010 workstation with XDE but not ViewPoint
- 8 Initialize 8010 workstation with XDE and ViewPoint
- 9 Return to MAIN MENU

Enter choice number, then press RETURN:1

Figure 2-3: Partitioning and Installation menu

The page sizes for each of the partitioning options are shown in Table 2.1.

Table 2.1: Disk partitioning

Partitioning Option	Software	Volume	Number of Pages
1	XDE	Tajo CoPilot	25,000 40,000
2	XDE & ViewPoint	Tajo User Scavenger CoPilot	11,100 25,000 2,500 26,400
3	XDE & Interlisp	Tajo Lisp LispFiles CoPilot	13,800 16,200 10,000 25,000
4	XDE, ViewPoint, & Lisp	Tajo User Scavenger Lisp LispFiles CoPilot	7,900 14,000 2,100 16,200 5,000 19,800

## Selecting a partitioning script

To select one of the partitioning scripts:

1. Enter the number of the script you want and press **<return>**.

**Note:** None of these options creates a CoCoPilot volume, since it is normally not needed. To create a CoCoPilot volume, refer to the *XDE User Guide* and the Command Mode procedure described above.

2. Partitioning the disk destroys the existing contents of the disk. You must respond to two requests for confirmation before the actual partitioning takes place. Confirm that you want to partition the disk by entering Y (for Yes) to each request:

**WARNING - PARTITIONING DISK DESTROYS ALL CONTENT**  
Continue? (Y/N): N

**SECOND CONFIRMATION REQUIRED**  
Continue? (Y/N): N

After you respond by entering Y to both confirmation messages, the partitioning begins and the message:

**Partitioning..... Takes approximately 5 minutes. Please wait.**

appears.

When the system has partitioned the disk, the message:

**Disk Partitioned**

appears, followed by the Partitioning and Installation menu. Proceed to "Procedure 4: Installing and initializing the software."

---

**Information on Interlisp**

---

The Partitioning and Installation menu contains the most common partitioning scripts for the 42 MB disk and includes options that partition the disk for Interlisp. The remainder of this document explains how to install and initialize XDE. If you need more information about Interlisp, please refer to the *Xerox 1108 User's Guide*.

---

**Procedure 4: Installing and initializing the software**

---

Once your disk is partitioned, you're ready to install the XDE Boot Files, and then the XDE Basic Tools, and Tutorials (options 5 and 6 in the menu). After the software installation, your workstation should be initialized by selecting option 7 or 8 from the menu.

**Note:** If you aren't familiar with using the floppy commands, refer to the *XDE User Guide* for instructions.

Choose the option you want from the Partitioning and Installation menu (Figure 2-4):

1. Enter 5, 6, 7 or 8 and press <return>.

Choices available:

- 1 Partition 42 MB disk into 2 volumes for XDE only
- 2 Partition 42 MB disk into 4 volumes: 2 for XDE and 2 for ViewPoint
- 3 Partition 42 MB disk into 4 volumes: 2 for XDE and 2 for Interlisp
- 4 Partition 42 MB disk into 6 volumes: 2 each for XDE, ViewPoint, and Interlisp
- 5 Install XDE Boot Files only
- 6 Install XDE User.cm, Basic Tools, and Tutorials
- 7 Initialize 8010 workstation with XDE but not ViewPoint
- 8 Initialize 8010 workstation with XDE and ViewPoint
- 9 Return to MAIN MENU

Enter choice number, then press RETURN:5

Figure 2-4: Partitioning and Installation menu

2. Confirm your selection by entering Y (for Yes) to the confirmation message.

Each installation/initialization script is described below.

---

**Option 5: Installing XDE Boot Files only**

---

If you select option 5 (Install XDE Boot Files only), follow these steps:

1. Respond to a confirmation message:

**Ready to Install XDE Boot Files  
Continue? (Y/N): N**

Confirm that you want to install XDE Boot Files by entering Y and pressing <return>.

2. After confirmation, the workstation beeps and presents a series of messages telling you which disks to insert. The first message reads:

**This Floppy Disk is labelled "XDE 5.0 Installer."  
Insert Floppy Disk labelled "XDE Boot1" in Floppy Disk  
Drive.  
Is the requested floppy disk now loaded? (Y/N): Y**

3. Insert the requested disk and press <return>.

4. The system now displays the message:

**Installing Boot Files (part 1)...**

When all the files have been transferred from the XDE Boot1 disk to the hard disk, the message:

**Floppy closed**

appears.

5. Subsequent messages (each preceded by a beep) direct you to load:

**XDEBoot2 (Boot Files part 2)**

**XDEBoot3 (Boot Files part 3)**

The terminal beeps and displays the message:

**Floppy closed**

to inform you when each floppy has been read. The message:

**XDE Boot Files Completed  
Floppy Closed**

appears after all three disks are read.

---

## Option 6: Installing XDE User.cm, Basic Tools, and Tutorials

---

If you select option 6 (Install XDE User.cm, Basic Tools, and Tutorials), you must have:

- installed the XDE Boot Files from floppy disks as described in option 5 above.

To install the User.cm, Basic Tools, and Tutorials, follow these steps:

1. Respond to a confirmation message:

**XDE Boot Files should be installed first  
Ready to Install XDE User.cm, Basic Tools, and Tutorials  
Continue? (Y/N): N**

Confirm that you want to install XDE User.cm, Basic Tools and Tutorials by entering Y and pressing <return>.

2. After confirmation, the workstation beeps and presents a series of messages telling you which disks to insert. The first message reads:

**This Floppy Disk is labelled "XDEBoot3."  
Insert Floppy Disk labelled "XDEBasicTools" in Floppy Disk Drive.  
Is the requested floppy disk now loaded? (Y/N): Y**

3. Insert the requested disk and press <return>.
4. The system now displays the message:

**Installing XDE Basic Tools (part 1)...**

When all the files have been transferred from the XDE Basic Tools disk to the hard disk, the message:

**Floppy closed**

appears.

5. Insert the requested disk and press <return>.
6. The system now displays the message:

**This Floppy Disk is labelled "XDBasicTools."  
Insert Floppy Disk labelled "XDETutorials" in Floppy Disk Drive.  
Is the requested floppy disk now loaded? (Y/N): Y**

When all the files have been transferred from the XDE Tutorials disk to the hard disk, the message:

**XDE Basic Tools, and Tutorials Completed  
Floppy Closed**

appears.

---

## Option 7: Initializing the 8010 workstation with XDE but not ViewPoint

---

If you select option 7 (Initialize 8010 workstation with XDE but not ViewPoint), you must have:

- installed the XDE Boot files from floppy disks as described in option 5 above.

When you initialize the workstation, you define and activate the relationship between volumes on the disk and then run a bootstrap operation. Follow these steps to initialize:

1. Respond to a confirmation message:

**Ready to start? (Y/N): N**

Confirm that you want to start by entering **Y** and pressing **<return>**.

During initialization, the screen first goes blank; then the hourglass symbol appears. A series of windows then appears. (This takes about three to four minutes).

When the upper-left scroll bar becomes dark gray and the cursor appears as a double-headed arrow, move the cursor to the command **Display!** in the MailTool window and press the left mouse button. The system now presents the XDE Tutorials.

If you decide not to initialize the workstation by entering **N**, the message:

**Terminated at user request**

appears. Select one of the options from the menu and proceed.

---

## Option 8: Initializing the 8010 workstation with XDE and ViewPoint

---

If you select option 8 (Initialize 8010 workstation with XDE and ViewPoint), you must have:

- downloaded the ViewPoint software from the network or from floppy disks (for more information, refer to the section "8010 Software Installation" in the *ViewPoint Series Reference Library*)
- installed the XDE Boot Files from floppy disks as described in option 5 above.

When you initialize XDE on the workstation, you define and activate the relationship between volumes on the disk and run a bootstrap operation. Follow these steps to initialize:

1. Respond to a confirmation message:

**Ready to start? (Y/N): N**

Confirm that you want to start by entering **Y** and pressing **<return>**.

During initialization, the screen first goes blank; then the hourglass symbol appears. A series of windows then appears. (This takes about three to four minutes).

When the upper-left scroll bar becomes dark gray and the cursor appears as a double-headed arrow, move the cursor to the command **Display!** in the MailTool window and press the left mouse button. The system now presents the XDE Tutorials.

If you decide not to initialize the workstation by entering **N**, the message:

**Terminated at user request**

appears. Select one of the options from the menu and proceed.

---

## Option 9: Return to MAIN MENU

---

This option allows you to return to the MAIN MENU. To select this option, enter **9** and press **<return>**.

---

## Procedure 5: Preparing to install from the network

---

Once you've installed XDE on one workstation, you can copy the XDE files to a file server. Then you can copy the XDE files from the file server to your remaining workstations. Before you do the copy from the workstation to the file server, you must perform the following steps:

1. Be sure the Clearinghouse Authentication Service, the File Service, and the Boot Service are installed on the network. Refer to *System Administration Library* for more information.
2. The Boot Service must be initialized and the Boot Service DataBase installed. Refer to the *System Administration Library, Boot Service* for more information.
3. The network must be prepared to support workstation installation. Refer to the *System Administration Library, Boot Service* for more information.
4. If you want to install ViewPoint in addition to XDE, refer to the section "Loading Software Floppy Disks on a Network"

in *Boot Service*. **Note:** These procedures apply to ViewPoint, not XDE installation.

---

## Procedure 6: Copying XDE from a workstation to the network

---

Once you've installed the XDE software from floppy disks onto a single workstation and set up the network, you can copy XDE from the workstation to a network file server. This process includes:

- creating a temporary directory at your workstation to contain the information from the XDE disks
- copying the XDE files to the temporary directory
- storing the contents of the temporary directory in the installation drawer of a network file server so other workstations can retrieve the XDE software from the file server
- destroying the temporary directory at your workstation.

---

### Creating the temporary directory

---

When you initialize XDE you activate CoPilot. To be sure that CoPilot is activated, position the cursor in the dark band at the top of any window. If CoPilot is active, the band video inverts. If the band does not invert, you must wait for CoPilot to become active before you proceed.

To create a temporary directory for the XDE files once CoPilot is active:

1. Activate the **Search Path Tool**.

**Note:** To activate a tool, position the cursor in the middle section of the band at the top of its tiny window and press the right (adjust) mouse button.

2. Position the cursor over **Directories:** in the **Search Path Tool** window and press the left (point) mouse button. Enter:

`<CoPilot> XDEBootFiles.`

3. Position the cursor over the command, **Create Dir!**, and press the left mouse button. This message displays:

`Created directory <CoPilot> XDEBoot Files.`

4. Position the cursor over the command, **Set!**, in the **Search Path Tool** window. Press the left mouse button.

5. Deactivate the Search Path Tool by placing the cursor anywhere in the center bar at the top of the window and pressing the right mouse button.

## Reading the XDE files from the floppies to the workstation

---

Once the temporary directory is created, you copy the XDE Boot Files, Basic Tools, and Tutorials from the floppies to your workstation. Follow these steps:

1. Position the cursor anywhere in the Executive window and press the left button of the mouse.
2. Copy XDE from the floppy disks:

For each floppy disk, beginning with XDEBoot1:

- a. Insert the disk in the disk drive.
- b. Enter:

**Floppy read '\***

in the Executive window and press <return>.

- c. When the > symbol appears in the Executive window, remove the floppy disk.

Repeat Steps 1 and 2 above for the rest of the floppies, copying them in this order:

**XDEBoot2**

**XDEBoot3**

**XDE Basic Tools**

**XDE Tutorials**

## Logging on to the system

---

Next, you need to be logged onto the network system. To do this:

1. Activate the Profile Tool.
2. Position the cursor over the User: field of the Profile window and press the left mouse button. Then press the DELETE key. Enter your user name.

**Note:** You must be registered on the Clearinghouse and have Write Access in the File Server Installation Drawer.

3. Press the **SKIP NEXT** key and enter your password.
4. Press the **SKIP NEXT** key two times and enter your Domain.
5. Press the **SKIP NEXT** key and enter your Organization.
6. Position the cursor over the **Apply!** command and press the left mouse button.
7. Deactivate the Profile Tool window by placing the cursor in the middle of the dark band at the top of its window and pressing the right button of the mouse.

---

## Storing the XDE files on the file server

---

Once you're logged on, you can store the XDE files on a file server. Follow these steps:

1. Activate the File Tool.
2. Position the cursor in the **Host:** field of the File Tool window and press the left button of the mouse. Enter the name of the file service that has the alias, **Installation Server**. (The alias was assigned when the boot service was prepared to support network installation. If you are not sure of the name, ask your System Administrator).
3. Press the **SKIP NEXT** key and enter:  
  
    **<Installation Drawer>**  
  
    in the **Directory:** field.
4. Press the **SKIP NEXT** key and enter an asterisk (\*) in the **Source:** field.
5. Position the cursor over the **Store!** command and press the left mouse button. The command subwindow of the File Tool window disappears and reappears when the command is finished.

---

## Deleting the temporary directory and files

---

Once the XDE files are stored on a file server, you no longer need them stored on your workstation. To delete the files and their directory, follow these steps:

1. Position the cursor anywhere in the Executive Window and press the left mouse button. Enter:  
  
    **Delete \***  
  
    and press **<return>**.

The system lists each file it deletes. The > symbol appears when the all the files are deleted.

2. Activate the **Search Path Tool**.
3. Position the cursor over the **Directories:** field and press the left mouse button. The field now appears in reverse video. Press the **DELETE** key.

4. Enter **<CoPilot>** in the **Directories:** field. Position the cursor over the **Set!** command and press the left mouse button. The message,

**Search Path Set to CoPilot**

appears.

5. Position the cursor over the **Directories:** field and press the left mouse button. Press the **DELETE** key. Enter:

**<CoPilot> XDEBootFiles**

6. Position the cursor over the command **Destroy Dir!** and press the left mouse button. The message,

**Destroyed Driectory**

now appears.

## Sword script

---

A sample script is provided with Sword, the same-world debugger, to partition a 40 MB disk for an 8010 machine with XDE and ViewPoint. The script also installs the microcode and XDE bootfiles from the network.

Copy the script, XDE5.0SwordSample.DlionScript, to the Installation Drawer. When you boot from the network boot service, the option to partition the machine for Sword appears on the installation menu.

If you want to partition or install for some other configuration, you'll have to modify the sample script.

---

## Procedure 7: Retrieving XDE software from the network

---

Once the microcode, the XDE boot files and scripts are stored on the Installation Drawer and the Boot Service is activated, you can install XDE software on a workstation from the network (rather than from floppy disks). Network installation is much faster.

To install from the file server:

1. Do a Boot 3:

- a. Simultaneously press both the **B RESET** button and the **ALT B** buttons.
  - b. Release the **B RESET** button, and wait until **0003** appears on the workstation maintenance panel, then release the **ALT B** button.
2. After a few seconds the screen clears and the logon prompt appears. Enter your fully-qualified name:

Name:Domain:Organization

and press **<return>**.

3. Enter your password and press **<return>**. The message,

**Logging on ...Done**

appears.

4. When a menu appears, select:

**XDE5.0Installation**

5. Select the options to partition the disk and install XDE (See Procedures 3 and 4 for more information). These procedures usually ask you to insert floppy disks. You won't be requested to do that because the files are retrieved from a file server.

Messages now appear telling you that the file server is transferring the XDE software to the workstation.

6. When XDE has been retrieved from the network and installed on the workstation, the message,

**XDE Software Installation Completed**

appears.

---

#### 3.1 Pilot 12.3 problems and restrictions

---

The problems and restrictions in the Pilot 12.3 release are:

##### **MICROCODE AND DIAGNOSTICS**

- The RS232C.Get will change the maximum block size correctly if the client program first does a RS232C.Suspend[channel: channelHandle, class: input]. The reason that RS232C.Get appears not to work correctly is that the assembly code has already set up the next block and is fetching characters without waiting for the client to issue another RS232C.Get. However, if the input has been suspended, it is safe to change the block size.

- Clients of the bit-synchronous RS232C loopback test should not specify data sizes of more than 600 bytes (contrary to the interface, which allows 1000 bytes). The test will only receive such large frames once; then the input side becomes inoperative.

When running the asynchronous RS232C loopback test, the minimum and maximum data size is ignored because the concept of framing is invalid for asynchronous lines. The actual buffer size used for the Get and Put operations is 500 bytes.

- Clients running "**BackCompatibleDiag.bcd**" as their communications online diagnostics should note the following restrictions:

Dialup test: If the target server is an old machine, the DialerType is ignored.

Echo test: If the target server is an old machine, only one echo test may be run at a time. This applies not only to attempting multiple tests on the same old server, but also to attempting multiple tests on different old servers from the same client side. In either case, the error "CommError[tooManyConnections]" is raised.

RS232C test: If the target server is an old machine, only one RS232C test may be run at a time. This applies not only to attempting multiple tests on the same old server, but also to attempting multiple tests on different old servers from the same client side. In either case, the error "CommError[tooManyConnections]" is raised. If the target server is an old machine, the

parameters "clockSource" and "waitForDSR" are ignored.

#### PILOT

- The PhysicalVolume Scavenger fails if the volume scavenged contains no logical volumes and its root page is damaged, unreadable, or inconsistent. This can be avoided by creating at least one logical volume when creating a physical volume. This will assure that the disk can be scavenged if the physical volume root page is ever damaged.
- When partitioning a disk, it is imperative to use all disk pages available. Otherwise, if the disk is later damaged, the physical volume may be unscavengable.
- The *Pilot Programmer's Manual* states that Scavenger.GetLog returns File.nullFile if there is no log file. If the log file does not exist, the current implementation may return a File.File. with its volumeID field not equal to Volume.nullVolume. However, the fileID field is always returned as File.nullID if the log file does not exist.
- Files that are larger than approximately 15/16ths of the volume's free page count cannot be created by Pilot. This is most likely to occur when you install new boot files on small or relatively full volumes. A specific known example is installing PupOthelloDove.boot on a 1300-page volume with the microcode and the boot file is the last file to be installed.
- World-swap debugging of bootfiles built with Pilot 12.3 PilotKernal.bcd must be done by a 12.3 CoPilot debugger.

---

## 3.2 ViewPoint Programming Package problems and restrictions

---

The problems and restrictions in the ViewPoint Programming Package are:

- Many of the higher-level VPP interfaces are not properly MONITORed and should therefore be called from non-Notifier processes with great care, if at all. FormWindow, ContainerWindow, StarWindowShell, and PropertySheet are in this category. Lower-level interfaces, such as Window, TIP, and Context are properly MONITORed.
- Writing TCP/IP applications using the programming interfaces is limited to the XDE environment until ViewPoint 2.0 is released. TCP/IP requires 12.3 bootfiles and ViewPoint 1.1 is based on 12.2.
- FormWindow
  - WrapUnderTag is not implemented.
  - Display template for Decimal Items is not implemented.
  - Large values of FormWindow.ItemKey implies large storage required.

- Application Loader

An application folder external name (the one you see on the icon) cannot have a slash ("/") in it.

- Keyboards

Mousing a key in the keyboard window registers the keyDown and the keyUp BOTH at the time of the mouse buttonUp.

- XMessage

Null messages, such as messages with no text, are not supported.

- Message file tools

Applications that use XMessage must not be loaded after the Message Master Creation tool.

## UNBOUND EXPORTS

ContainerWindow  
SetSource

### TIP

StuffTrashBin, caretRate

### XFormat

NSStringProc, NSStringObject

### XLReal

PictureReal

## DOCUMENTATION

The ViewPoint Programming Package includes some interfaces that are not documented in the *ViewPoint Programmer's Manual*. If you cannot find an interface item in *INTERFACENAME*, look in *INTERFACENAME.EXTRA*.

If you boot ViewPoint with the 'd and 'S switches set, the system returns to CoPilot and displays the warning message, "S switch detected. Proceeding will delete all system files" before it deletes any files. After deleting the system files, the system displays the informational message, "Done deleting system files. Reinstall and reboot or proceed if already installed."

### 3.3 Mesa 12.3 problems and restrictions

---

The known problems and restrictions in the Mesa 12.3 release are:

#### TAJO

- If you fill up your disk on a development environment volume, it may not boot. There are several ways to work around this situation. The best solution is to boot a development environment volume (Tajo or CoPilot) of the same or a higher type, open the full volume for writing by the "OpenVolume." volumeName/w" command, and delete files. If the full volume contains a CoPilot, you can generate free space by installing a Tajo boot file, which is considerably smaller. If necessary, you can retrieve a boot file onto a volume that doesn't normally contain the development environment, delete the files from the full volume, and then restore the volume to its original boot file. If you cannot do this for some reason, consult your local support group. They can provide you with a smaller boot file for scavenging.
- TIP: If you are creating a TIP table, you should make sure that the ENTER or EXIT productions do not come first in the table. Otherwise, they may trigger a bug in the Notifier that causes it to lock up.
- Do not invoke Supervisor.NotifyAllSubsystems from Tajo or CoPilot. (You may invoke it in other environments.)
- Do not use the "Power Off" command from the Exec Ops menu.
- Changing the current selection while running a program that takes its input from the current selection (such as Print \$\$\$) can cause an address fault.
- FileTransfer: ReadStream with StreamType = temporary is not implemented for NS file services.

#### TOOLS

- Executive: There is a bug in the Executive command look-up algorithm. It does not distinguish between failure to find a command because there is no command that matches the command prefix and failure because there are too many commands (the prefix is ambiguous). As a result, if you type a non-unique prefix, the Executive may try to load one of those programs again. (See the description of command line interpretation in the Executive chapter of the *XDE User Guide* for the exact steps taken by the Executive if it cannot find the requested command.) You then have several instances of the program loaded, and your command prefix will still not be unique. To avoid this bug, use only unique prefixes. If one command is a prefix of another command, you may have to include the "." at the end of the command. For example, if you have two commands, Copy." and Copy2.", the prefix Copy is not unique. The only way to invoke the first command is by typing Copy.". You can alleviate aggravating instances with the

use of the Executive's AliasCommand." and ChangeCommandName." commands.

- **MakeDLionBootFloppyTool:** There is a bug in changing the installed boot file on a floppy. The workaround is to reformat the floppy and reinstall the germ as well as the new boot file. This requires a germ to be supplied whenever a new boot file is put onto a floppy.
- **Performance Tools:** while setting up the Performance Tool, newing or unnewing modules will cause a crash with an address fault.

#### COPILOT

- **World-swap debugging of bootfiles built with Pilot 12.3** PilotKernal.bcd must be done by as 12.3 CoPilot debugger. Bootfiles before 12.3 can be world-swap debugged with either 12.3 or earlier bootfiles. Teledebugging can be done independently of which version of Pilot the debugger and the software being debugged are running.

---

### 3.4 C Environment problems and restrictions

---

The problems and restrictions in the C environment are:

#### C COMPILER

- Programs longer than 65,536 characters have accurate source position information during debugging for only the first 65,536 characters.

#### LINKER

- The /s option used to create a symbols file for a configuration is not available.

#### DEBUGGER

- All but the first dimension of an n - dimensional array may be recorded incorrectly in the symbol table. For instance:

```
int x[3],y[10][5];
```

the dimension of y would be recorded as 10,3 instead of 10,5. The contents of y is correct, but the symbol information is not available to the debugger for source level examination.

#### C ENVIRONMENT

- If you don't run your C programs in CTool or CExec, be sure to see the *C Reference Guide* for information to provide correct runtime and storage management.
- Programs executed in the CTool/CExec can't be unloaded from the Executive. Programs appear to unload successfully, but the C runtime support becomes inconsistent with other

operating system data structures. Unload your programs through the CTool/CExec to properly unload them.

### **BWSCENVIRONMENT**

- **BWSEnvironment.bcd** does not appear in the BWS loader icon after you've rebooted unless you are using the "Developer mode" of the BWS. To get around this problem, keep a copy of **BWSEnvironment.bcd** on your desktop, and only use the COPY key to load the BWSEnvironment on the loader icon.

### **VIEWPOINT VENEER**

- The ViewPoint veneer does not cover all the ViewPoint interfaces that many ViewPoint applications need. You may need to expand the veneer for your applications. The ViewPoint veneer should be considered an example of interfacing C to Mesa, rather than a full veneer of the ViewPoint programming environment.

### **RESTRICTIONS FROM BERKELEY 4.2 COMPILER**

- Mixed mode multiplication and division are not fully supported. For example, the following code gives undefined results:

```
char c = 10
double d = 1.21;
```

```
c * = d;
c / = d;
```

You can get the intended effect like this:

```
c = c * d;
c = c / d;
```

- Bitfield overflows give undefined results. For example:

```
struct fields
{
    unsigned x3:3;
} b;
```

```
b.x3 = 9;
```

- Pointer casts appearing on the left-hand side of an assignment do not work. For example, the following code results in an error message:

```
char *p;
(int *)p = 0;
```

- Nested typedefs are not allowed. For example, the following code results in an error message:

```
typedef char x;  
{  
typedef int x;  
}
```

---

## 3.5 TCP/IP problems and restrictions

---

The problems and restrictions for TCP/IP are:

### TCP

- Precedence and security are ignored from both client and incoming packets. Security is set to unclassified on outgoing packets. The type of service on outgoing packets is set to [precedence, normal delay, normal throughput, normal reliability].
- The time-to-live field is always set to 60 seconds.
- Attempts by clients to pass options are ignored.
- There is no enforced "quiet time" between connections.
- Use of long packets is expensive and unstable.

### IP

- Options are ignored from both client and incoming packets.
- Unloading is not supported.
- Packet reassembly has not been tested.
- IPMs is not given to clients.
- Does not respond to the all zero broadcast address according to UNIX 4.2Bsd.

### ARPAADDRESSTRANSLATION

- Only the HOST field in HOSTS.TXT file is supported.
- Domain naming is not supported.

### ARPACHAT

- Crashes when trying to remote echo to a host that does not remote echo.

#### **ARPAFILE TOOL**

- Unloading is not supported.
- Multiple file retrieval is not always reliable (the second data connection sometimes cannot be established). Try single file retrievals separated by about a 30 second interval. A PORT command is not issued to allow for the use of a different port for each file transfer and the TCP close must complete before using the port again.

#### **ARPAFILESERVER**

- Unloading is not supported.
- All users have access to everything. No user authentication is done.

#### **ARPAFTP**

- Only a subset of the complete protocol is used. Commands implemented are ABOR, ACCT, DELE, LIST, MODE, NLST, NOOP, PASS, PASV, QUIT, REIN, RETR, RNT0, RNFR, STOR, STRU, TYPE, and USER.

#### **ARPAFTPSERVER**

- Only a subset of the complete protocol is used. Commands implemented are ABOR, ACCT, DELE, LIST, MODE, NLST, NOOP, PASS, PASV, PORT, QUIT, REIN, RETR, RNT0, RNFR, STOR, STRU, TYPE, and USER.
- UnRegister is not supported.
- There is no upper bound on the number of connections supported.

#### **ARPAMAILTOOL**

- Distribution lists are not supported.
- Not having a mail file specified when you load this tool can cause it to crash.
- When sending mail there is no way to cancel the whole transfer. You can cancel transfers to individual hosts.
- When using answer, names used can be invalid because of a user-defined name space (HOSTS.TXT).

#### **ARPASMTP**

- Only a subset of the complete protocol is used. Commands implemented are DATA, HELO, MAIL, NOOP, QUIT, RCPT, and RSET.

**ARPA SMTP SERVER**

- Only a subset of the complete protocol is used. Commands implemented are DATA, HELO, MAIL, NOOP, QUIT, RCPT, and RSET.
- There is no upper bound on the number of connections supported.

**ARPA TELNET**

- Terminal type "subnegotiation" is not supported.

**TFTP**

- UnRegister is not supported.
- There is no upper bound on the number of connections supported.
- Only base subset supported; no extensions supported.

**A. DIRECTORY LISTINGS**

## Quick Reference Installation Guide

### Quick Reference Guide for Installing XDE Software on the 8010 Workstation

#### 1. Setting the time on a workstation.

**Note:** This step is necessary only if your 8010 workstation is isolated from the network.

1. Insert the **XDE 5.0 Installer** disk into the 8010 floppy disk drive and simultaneously press both **B RESET** and **ALT B**. When 0001 appears, release **ALT B**. If the workstation is isolated, set date and time as follows:

	<u>Screen display</u>	<u>Enter</u>	<u>Comments</u>
a	Locating Time Server...Time is not set		
b	Time zone offset from (for example)  Greenwich [-12 .12]:	<b>-8&lt;return&gt;</b>	Enter -8 for Pacific time, -7 for Mountain time, -6 for Central time, and -5 for Eastern time
c	Minute offset [0 59]:	<b>0&lt;return&gt;</b>	
d	First day of DST [0 366]:	<b>121&lt;return&gt;</b>	
e	Last day of DST [0 366]:	<b>305&lt;return&gt;</b>	
f	Please Enter the date and 24 hour time in form MM/DD/YY HH:MM:SS		
g	Time: e g . 06/05/86 15:35:00	<b>&lt;return&gt;</b>	
h	Set time to 5-Jun-86 15:35:00		
i	Okay?:	<b>y&lt;return&gt;</b>	

#### 2. Software installation

1. If you have not performed Step 1, insert the **XDE 5.0 Installer** disk.
2. If qualified to use Command Mode, enter the code **911** and the password **laccepttherisk**. Otherwise, select **1** on Main Menu.

#### 3. Partitioning the disk

Select the partitioning script for your disk size.

#### 4. Installing and initializing XDE software

1. Select and confirm the installation of the XDE Boot Files.
2. Select and confirm the installation of the Basic Tools and Tutorials.
3. Initialize the workstation with the appropriate software.

#### 5. Preparing the network

Be sure that the Clearinghouse Authentication Service, the File Service, and the Boot Service are installed on the network.

#### 6. Installing XDE from a workstation to the network

1. Activate CoPilot and open the Search Path Tool. Create the directory for the XDE Boot Files. Close the Search Path Tool.

2. Read the XDE files from the floppies in to the workstation. Enter **Floppy read \*\*** and insert the floppies in the correct order.
3. Log on the the system.
4. Open the File Tool and use the **Store!** command to store the XDE files on the file server.
5. Delete the files from your workstation after they are stored on the file server.

#### 7. Load the XDE software on the remaining workstations by retrieving it from the network

1. Boot3 the workstation.
2. Enter your fully-qualified name and your password.
3. When a menu appears, select:  
  
**XDE5.0Installation**
4. Select the appropriate options to partition the disk.
5. Select and install the XDE Boot Files.
6. Select and install the Basic tools and Tutorials.
