TRADEMARK

The names WordStar, WordMaster, SuperSort, DataStar, I/O Master, and MicroPro International Corporation are trademarks of MicroPro International Corporation.

DISCLAIMER

MicroPro International Corporation makes no representations or warranties with respect to the contents hereof and specifically disclaims any implied warranties of merchantibility or fitness for any particular purpose. Further, MicroPro International Corporation reserves the right to revise this publication and to make changes from time to time in the content hereof without obligation of MicroPro International Corporation to notify any person or organization of such revision or changes.

NON-SUPPORT

The information in this publication is intended primarily for MicroPro dealers and OEM's who may require changes to respond to the needs and requirements of their customers, and for users familiar with assembly language programming for the 8080/8085/Z-80 computers and who are experienced in reading assembly listings and "patching" programs.

Due to the relatively low prices at which MicroPro International Corporation sells its software products to end users, MicroPro cannot provide free consulting services with regard to using the information contained in these <u>Customization Notes</u> or with regard to any modification or customization of WordStar not described in the <u>WordStar User's Guide</u>.

This publication may reveal features in the WordStar software which are experimental and unsupported; such features are noted as "experimental" or "developmental" or "unsupported" in the program listings and/or in the text. While the user is free to make use of these features if he finds them to work for his purposes as they stand, they are unsupported —— they may be altered or removed from future releases; deficiencies in these features, if any, may not be corrected.

Introduction

These Customization Notes contain listings and descriptions of the user-modifiable portions of WordStar other than those described in the WordStar User's Guide. A diskette accompanying the Customization notes contains source files for certain modules, plus a special program (RETEXT.COM) used in incorporating new embedded texts.

Additional software useful for changing some or all of the modifiable areas includes:

DDT (or other debugging program), usually supplied by your operating system vendor.

The Microsoft assembler M80 and loader L80. These are available from

MicroSoft 10800 N.E. Eighth, Suite 819 Bellevue, Washington 98004 U.S.A.

M80 and L80 are used in making changes in WordStar's menus and other texts. (Minor changes can also be achieved by patching.)

Use of M80 and L80 release 3.10 or newer is recommended. Older revisions of M80 may produce all-upper-case text. M80 releases prior to 3.00 may not assemble all statements used in the files supplied with the <u>Customization Notes</u>.

The reader is assumed to be familiar with reading assembly listings and "patching" programs. Readers who wish to alter WordStar's menus and texts by reassembling and reloading (as discussed below) are assumed to be familiar with 8080 assembly language programming.

It is recommended that the reader familiarize himself with Sections 14 and 15 of the <u>WordStar User's Guide</u>, and with the listings of the Terminal and Printer Modification Areas, USER1 and USER4 (in Appendix D of the WordStar User's Guide) before reading these notes.

The modifiable program modules presented in the $\underline{\text{Customization Notes}}$ are, briefly:

USER2: contains initial (default) values for insert toggle, on-screen formatting parameters, and page format; flag characters; display characters for markers; and many other initialization and miscellaneous items. Part of WS.COM (or whatever name you chose for your installed WordStar; also present in uninstalled WordStar file WSU.COM).

USER3: contains the keystroke command dispatch tables, allowing keys for commands to be altered and new "help" commands to be added. Part of WS.COM.

USER5: contains additional printer-related patch items, for daisy wheel and similar printers, and print formatting items. Part of WS.COM.

USER6: INPUT FILE NAME file control block patch area.

POEM: OEM daisy wheel and similar printer driver. Part of WSOVLY1.OVR. Must be patched using offset of -3A00 Hex as detailed below.

WSMSGS: the separate message text file, WSMSGS.OVR, containing all menus, all text for the help commands, and many prompts and other messages. By modifying WSMSGS, the menus and many other texts may be altered.

WSMSG2: extracted copy of all messages and texts embedded in the various other WordStar files. A special program (RETEXT) is supplied to incorporate modified versions of these messages into WordStar.

The files on the diskette supplied with the <u>Customization Notes</u> are:

WSMSGS.MAC: source file for WSMSGS. May be edited, assembled, and loaded to produce a modified WSMSGS.OVR file containing modified menus and/or other texts.

WSMSG2.MAC: source file containing texts which are embedded in other WordStar files. May be edited, assembled, loaded, then RETEXTed to change texts.

WSMSG2.COM: for convenience, an assembled, loaded copy of WSMSG2. May be patched then RETEXTed to change texts.

RETEXT.COM: Special program to incorporate WSMSG2 texts into WordStar release 3.0. Modifies files WSU.COM, WSOVLY1.OVR, and (if present) MERGPRIN.OVR.

NOTE: Additional files and modules referred to in these <u>Customization Notes</u> include the following files which are parts of WordStar: WSU.COM, WS.COM, WSOVLY1.COM, WSMSGS.OVR, MAILMRGE.OVR (the latter is part of the optionally supplied MailMerge Option), and the modules USER1 and USER4, which are part of WS.COM. All of the preceding are described in the <u>WordStar User's Guide</u>.

Listings are included in these <u>Customization Notes</u> for all of the modules described. The listings are commented heavily; read them for a detailed description of each item. The descriptions in these notes give a general description of the modules, plus much detail that complements the listing comments; the text does not attempt to duplicate the detailed information contained in the program comments. **Read the Listings.**

Modules USER2, USER3, and USER5 may be modified by the user only by patching.

Modules USER2, USER3, and USER5 are three of several modules which were combined with a linking loader after assembly to form WSU.COM; thus, they contain external references whose values are not shown in the listings. Generally, these external references are in locations that there will be no need to change, but if you do need to move or use one of them, examine the locations with your debugger to determine the value of the contents. These values will probably change with each release of WordStar.

Module POEM is a portion of the overlay file WSOVLY1.0VR. POEM may be modified by the user by patching WSOVLY1.0VR using special offset techniques as described below under the heading "Patching the OEM Daisy Printer Driver".

Modules WSMSGS and WSMSG2, together containing all of the menus and other texts displayed by WordStar, may be modified by patching or by reassembly and reloading as detailed below. Source files for these modules are supplied on the <u>Customization Notes</u> diskette.

Module WSMSGS is assembled and loaded separately, to become the file WSMSGS.OVR which must be on-line when WordStar is being used.

Module WSMSG2 is assembled and loaded separately, then incorporated into WordStar by running the program RETEXT as detailed below. The special program RETEXT is supplied on the <u>Customization Notes</u> diskette.

For the modules intended to be modified only by patching, absolute assembly listings are included in the <u>Customization Notes</u>. The alphabetic symbol table at the end of each of these listings is a useful aid in finding an item in the listing when the label is mentioned in the text. The listings are assembled for TBASE=100H; if you have a special WordStar which loads at a different address, add the appropriate offset to the addresses shown in the listings.

For WSMSGS and WSMSG2, source listings only are supplied. If you wish assembly listings, you may make them by assembling the source files supplied.

The next section contains additional discussion of the modules. The modules are discussed in the same order as the listings appear. The section after next, "Effecting Changes", gives information on patching, assembling, and loading. Be sure to read that section carefully before attempting to make changes in POEM, WSMSGS, or WSMSG2.

2. Descriptions of Modifiable Modules

Initialization and Miscellaneous Parameters (USER2)

File USER2 (see listing) contains user-patchable items relating to defaults, the operation of various features, and the characters used for various purposes other than commands. By patching items in this module, you can effect the following changes. See the listing for additional details about each item, plus additional items not shown here. The following descriptions correspond, in order, to the items in the listing; you may follow along in the listing while reading the following text.

- Make WordStar start with any help level 0 to 3, that is, with menus initially fully displayed, partly displayed, or fully suppressed (item ITHELP). If an initial help level of 1 or 2 is selected, you may also enable or suppress display of an additional message explaining how to select help level 3. This additional message, if enabled, is displayed once only, at the start of the first edit initiated after WordStar is invoked (item NITHLF).
- * Make WordStar start up with the insert toggle off or on as desired (item ITITOG)
- Make WordStar start with directory display at the no-file menu off or on as desired (item ITDSDR)
- * Alter the default paper length, top margin, and other page format values used when not specified by dot commands in the document (INITPF)
- Change the initial editing left and right margins (items INITLM and INITRM). These margin values are also used to determine the initial page number column for the print function, and also the initial right margin for Merge-Print's print time line forming (the print time line forming initial right margin is significant only if print time line forming occurs before a soft carriage return is encountered).
- * Change the initial subscript/superscript roll used when printing on daisy wheel or similar printers (item INITSR)
- Change the initial values for document edits (edits initiated with a D command) of the following (INITWF):

word wrap on/off
justification on/off
variable tabbing on/off
soft hyphen entry on/off
print control display on/off
page break display on/off
line spacing 1-9

- * Change the "decimal point" character (normally period) that terminates the right-aligning action at decimal tab stops (item DECCHR)
- * Change the lead character of dot commands (normally period) (DOTCHR)
- * Suppress the interpretation of dot commands by the edit function (item DOTSON)
- Increase or decrease the tendency for paragraph reform (with hyphenhelp ON) to stop to allow the operator to decide whether a word is to be hyphenated. For more hypenation stops, put a smaller value in item HZONE. For fewer hyphenation stops (more tendency to move the word that fits partly on a line to the next line), put a larger value in HZONE. A larger value in HZONE increases the number of characters in the word that must fit on the line before WordStar will propose hyphenation and stop to allow the operator to check the hyphen position, rather than place the entire word on the next line and continue reforming without a stop.
- Change the tables used in classifying letters as vowels or consonants by hyphen-help. Such classification is used to syllabify words to determine that they are hyphenable (i.e. contain two or more syllables) and to determine the cursor placement (at a probable syllable break) at a hyphenation stop. If WordStar is to be used with a language other than English, particularly if additional character codes are to be used to represent vowels with accent marks, it may be desirable to change these tables. The label VOWTAB is the beginning of a table containing all characters to be treated as vowels. The label NONCON is the beginning of a table containing all LETTERS (A-Z) which are NOT consonants. Note that this table scheme allows a letter to be considered to be both a vowel and a consonant, as Y is in English. Each table consists of an indefinite number of characters, followed by a byte containing zero. The two tables may (and normally do) overlap. If it is necessary to change the beginning location of either table, adjust the corresponding pointer at PVWTB or PNCON.

A commonly desired change to VOWTAB / NONCON (previous paragraph) is to define one or more additional vowel codes. This may conveniently be achieved by entering the codes in the zeroes after the DB 'AEIOU' in NONCON (but be sure to leave at least one zero byte before the next non-zero byte), or by changing one or more of the bytes in the DB '[]{}' in VOWTAB.

- * Change the "flag" characters displayed in the rightmost screen column
- * Change the character used to display soft hyphens (item SOFHYC)
- * Change the characters used to display block and place markers (MARKS)
- * Change the defaults for all of the yes / no questions in the print initiation dialog (PODBLK)

WordStar

* Change the default values for the following print function parameters (these parameters may also be explicitly set with dot commands in the document):

omit page numbers on/off (item ITPOPN) microjustification on/off (item ITMIJ) bidirectional print on/off (item ITBIP)

- * Change the delimiter character (normally comma) and the quote character (normally ") used in data files read under control of the Merge-Print .DF and .RV dot commands. Note, however, that if you change these characters, Merge-Print will no longer be compatible with MicroPro DataStar and may be less compatible with MicroPro SuperSort and with files produced by BASIC and other languages.
- * Change the characters (normally "&") used before and after the variable's name in a variable reference in a form letter or other document to be Merge-Printed. The character that precedes the variable name (item VARCH1) and the character that follows the variable name (item VARCH2) may be made different from each other if desired.
- * Change the characters used to specify options in a Merge-Print variable reference, such as the characters (normally "/O") used after the variable name to specify omission of the entire line if the variable is null (item VAROPC).
- Alter the name of the WS.COM file (item FNWSCM). This name is automatically set to the name chosen during INSTALLation, and is used by the R (run program) command to reload WordStar after completion of the program. You might wish to patch this item if the file is renamed after INSTALLation, though normally this item can be conveniently changed by rerunning the INSTALL program instead of renaming the file.
- * Alter the name of the message texts file (normally WSMSGS.OVR) and the overlay files (normally WSOVLY1.OVR and MERGPRIN.OVR)
- Define up to 10 characters after which WordStar will automatically enter a "backspace" print control character (WordStar 2.2 and newer only). This automatic-backspace feature may be used to facilitate entry of text in languages that use accent marks, when the "backspace" print control character is being used to print an accent mark and a letter in the same position. Automatic-backspace characters may be defined by patching the desired codes into the zero bytes starting at AUTOBS. For exaple, if "`" is patched into the AUTOBS table, the operator may then enter "à" by pressing the "`" key, then the "a" key. (If ` is not defined as an autobackspace character, the operator must press the following keys to enter à: `, control-P, H, a.)

Changing Command Keys (USER3)

File USER3 (again, see listing) contains the dispatch tables for the operatorentered commands. There are three tables:

> No-file commands (NOFTAB) Editing commands (VTAB) Merge-Print commands (FPTAB)

These tables may be patched to change the keys which perform command functions, as to arrange the keyboard to your preferences, or to make function keys on your terminal active. Existing table entries may be altered, or duplicate entries for the same function may be added in the space provided at the end of each table.

Comments in the listing explain the format of table entries. When creating duplicate entries, be sure to copy the address for the function desired carefully from the existing entry. Examine with DDT to determine the address, and remember that these addresses will change from release to release.

The command dispatch tables may be moved, if desired, for example to redistribute the patch space amoung the tables. If the beginning of one or more of the tables is relocated, update the appropriate pointer or pointers at PNFTAB, PVTAB, and/or PFPTAB.

If you change the interrupt character, normally control-U, note that this character appears two places which must match: in the main dispatch table, VTAB, and in a special item on the last page of the listing, STPCHR.

Also in USER3 are patchable items for several of the control characters interpreted during entry of question answers, such as file names:

backpace (delete character) (CLCHR)
forward space (undelete character) (CRCHR)
take the next key as part of the answer (LITCHR)
directory display/scroll up/scroll down (DIRCH)

If you change the cursor control keys, the 'P prefix, or the directory display or scroll commands, you will probably want to change these to match.

Finally, the error release character (normally ESCAPE) may be changed (ERELCH).

After changing or adding command keys, you may wish to alter the menus to correspond. See "Menus and Other Texts" below.

The user may create new "Help" commands (commands that display text on the screen) by modifying USER3 and WSMSGS. See comments in USER3 listing above the label "XTAB" (about page 10), and see WSMSGS description below. A help command entry in NOFTAB or VTAB is like other command entries except the index into WSMSGS's pointer table replaces the address. This index must be less than 100 Hex; thus, only pointers between 180 Hex and 27F Hex in WSMSGS may be used. Of course, a presently unused pointer (DW SPARE in the listing) must be used when creating a new command. Put an 18 Hex byte in the text at points where you want WordStar to wait, with the preceding text on the screen, until the operator presses a key.

Daisy Printer Items (USER5)

Module USER5 -- see listing -- contains printer-related and print formatting items that are used for daisy wheel and similar printers only. Recall that modifiable items that relate to Teletype-like printers, and to both Teletype-like and daisy printers, are in USER4, listed in Appendix D of the WordStar User's Guide and discussed in Section 15 thereof. The following descriptions correspond in order to the items in USER5.

Function Strings For Serial Daisy Printers: these are the strings and related parameters for functions specific to particular serial daisy wheel and similar printers. These items also apply to 8-bit parallel (e.g. Centronics-like) printers, but they do not apply to 0EM interface daisy and similar printers (see module POEM).

The functions include, for example, setting the vertical motion index in 48ths of an inch, setting the horizontal motion index in 120ths of an inch (60ths if DHMIFG is patched non-zero), moving the carriage in four directions, and printing phantoms. See the listing comments for details.

All of these items are set appropriately when a daisy wheel or similar printer is installed using the INSTALL program. The enterprising user might wish to patch them to adapt WordStar to one of the relatively rare daisy wheel printers not supported by the INSTALL program.

All of the following items in USER5 are EXPERIMENTAL and UNSUPPORTED. These features are subject to change or deletion; bugs in them, if any, may or may not be fixed by MicroPro.

Flags for Daisy Printers: These apply to both serial and OEM daisy printers; they may be set non-zero by patching only; they effect minor changes in print formatting:

DNPROS: set non-zero to print all characters the same width (normally, M's and W's are printed 1/60th wider than the character pitch in use, and periods, commas and other punctuation characters are printed narrower, when formed text is being printed on a daisy wheel or similar printer and Microjustification has not been disabled).

DMJWB: set non-zero to modify the Microjustification algorithm to allow more variation in the amount of space between words; the result will be that the character spacing within a word will be altered less often. DMJWB effects the printout only when printing formed text on a daisy wheel or similar printer with Microjustification on.

Proportional Spacing Table: This table is used when printing formed text on a daisy wheel or similar printer (either serial or OEM) and microjustification is on. The table is indexed by character value less 20 hex.

The left nibble of each byte in the proportional spacing table is normally used; it implements the minor variation in widths used by WordStar when printing formed text on a daisy wheel or similar printer with Microjustification on. These minor variations in character width are intended to enhance the appearance of printout when using a "non-proportional" printing element (daisy print wheel or NEC print thimble).

The right nibble of each byte in this table is used when the EXPERIMENTAL, UNSUPPORTED, and otherwise undocumented proportional spacing toggle (print control character ^P; next paragraph) is on. The table is currently set up for use with a Qume Theme P. S. 10 print wheel (and .CW 8) and will require patching for use with other print wheels.

(The EXPERIMENTAL, UNSUPPORTED, and otherwise undocumented proportional spacing feature is toggled on and off with a control-P print control character embedded in the text. When on, WordStar will attempt to proportionally space during printout the lines formed by the editor without regard for varying character widths. The relative widths only of characters are varied; the line length and number of characters on a line are left as formed by the editor. Thus, optimum printout appearance may not occur when a line contains an unusually large proportion of narrow characters such as i's or .'s, or an unusually large proportion of wide characters such as M's and W's. This proportional spacing action will only occur where Microjustification would normally occur: it will not occur in the last line of a paragraph unless the line is explicitly formed with B: it will not occur when .UJ OFF is in effect. The proportional spacing action may not occur on lines containing one word only. As noted in the preceding paragraph, if you wish to use the experimental, unsupported proportional spacing feature, you will normally need to patch the proportional spacing table to the correct relative character widths for the typewheel you wish to use.)

OEM Daisy Wheel Printer Driver (POEM)

As coded, the driver drives a Diablo Hy-type II or compatible printer, specifically:

Diablo Hy-Type II 1300 Series Qume Sprint 3 with cable adapter to make Diablo-compatible Nec Spinwriter 5500D

Diablo Hy-Type I (patch DHMIFG non-zero or make appropriate INSTALL selection)

The interface assumed is the MicroPro "I/O Master", or three parallel ports at port numbers F8 through FA (for example, IMSAI PIO-4 board) with appropriate bit assignments. The enterprising user may wish to patch the driver to accommodate other port or bit assignments, or to drive a printer that is not Diablo-compatible but has similar capabilities. Before attempting to locate and patch the POEM code, be sure to read carefully "Patching the OEM Printer Driver" below.

As detailed in the program comments, this driver's entry points and calling sequences are completely different from those of the other printer drivers. Since most OEM daisy printers do not have form feed features, the driver simulates form feeds if "USE FORM FEEDS" is specified when print is initiated.

When the OEM daisy printer driver is in use, the following parameters are pertinent. Most of these parameters are in USER4, listed in Appendix D and discussed in Section 15 of the <u>WordStar User's Guide</u>. The other printer function strings and most flags in USER4 and USER5 are not used; in particular, POSMTH is assumed to be 1 regardless of actual contents.

CSWITCH must be 3 to invoke OEM daisy printer driver

HAVBSY should be non-zero

DBLSTR should be 2 or as desired

BLDSTR should be 2 (no other value)

DHMIFG (in USER5) should zero if the printer moves in 120ths of an inch (Hy-Type II), or FF hex if the printer moves in 60ths

of an inch (Hy-Type I).

OEMPAG (in POEM) desired form length in 48ths of an inch for simu-

lated form feeds

The POEM listing in these <u>Customization Notes</u> is a partial listing of one of the modules combined by MicroPro to form the overlay file WSOVLY1.0VR. (The listing published normally has no page 1.) The code is read in from this file at initiation of a print to an OEM Daisy printer. The addresses shown in the POEM assembly listing are the addresses at which the code runs. However, when modifying the OEM daisy printer driver by patching WSOVLY1 with DDT, the code will appear in memory at different addresses. Be sure to carefully read the section "Patching the OEM Printer Driver" below before attempting to locate and modify the POEM code.

There are no external references in the OEM daisy wheel and similar printer driver. All entries are via the JMPs on the first page of the code listing ("page 2"); all exits are with "return" instructions. All outputs are direct to the hardware ports. The only locations in the driver that are accessed from outside the driver are those shown on the first page ("page 2") of the code listing: (execution) locations 3C20 through 3C3E, or as shown in the listing. Thus, the rest of the code may be rearranged freely — locations 3C3F through 3CBC or as shown on the listing.

Menus and Other Texts (WSMSGS and WSMSG2)

All of the menus, prompts, and other texts displayed by WordStar may be altered by altering WSMSGS and/or WSMSG2. The texts are in two modules of different structures for implementation-related reasons as further described below. Changes may be made either by patching, or by reassembly and reloading, as described in more detail below. Patching is convenient for minor changes, and may be used when the additional software required for reassembly -- M80 and L80 -- is not available. Editing, reassembling, and reloading the source files is convenient for moderate changes and especially recommended for large changes such as translation to a different language.

If you wish to change a specific menu or text, find the desired text by looking through the listings, or by searching (e.g. with the WordStar Find command) the WSMSGS.MAC and WSMSG2.MAC source files supplied on the <u>Customization Notes</u> diskette.

WSMSGS: WSMSGS contains the texts which are read in from file WSMSGS.OVR as required during WordStar execution. WSMSGS includes all menus, most error and warning messages, and many other longer and less frequently used texts.

The source file WSMSGS.MAC, supplied on the <u>Customization Notes</u> diskette, may be assembled and loaded (details below) to produce a new WSMSGS.OVR file; minor changes may alternately be made by patching WSMSGS.OVR as supplied on your WordStar distribution diskette.

At the beginning of the WSMSGS.MAC file (as supplied on the diskette, and listed below) there are several assembly parameters (EQUates) that may be of interest to the modifier:

TBASE1 and TBASE2 are set to 100 Hex in the file as supplied; these should be changed appropriately for special versions for systems where programs load at addresses other than 100 Hex.

WIDE and NARROW respectively control inclusion of menus for screens 80 columns wide and wider, and menus for screens 64 to 79 columns wide. Both are ON (-1) in the file as supplied on the <u>Customization Notes</u> diskette. Turning off (0) whichever is not needed in your system will result in a shorter reassembled WSMSGS.OVR file.

Starting on about page 4 of the WSMSGS.MAC listing, and assembling into locations 180 Hex through 2FF Hex, is the table of pointers to the message texts. These pointers are read by WordStar at startup and used to locate the individual texts when required for display, to make it possible to freely change the lengths, locations, and order of the texts in WSMSGS.OVR without otherwise modifying WordStar. If WSMSGS is modified by reassembly, the assembler will produce the correct pointer values and no special attention is needed beyond insuring that the label at the beginning of each text is not changed and is moved with the text, should the texts be rearranged. If WSMSGS is modified by patching, whenever the beginning of a text is moved to a new location, the two-byte pointer to that text must be patched to contain the new address.

WordStar

NOTE: The length of the pointer table (previous paragraph) was increased for WordStar release 2.0. Do NOT attempt to use a WSMSGS file from a pre-2.0 release with WordStar 2.0 or newer.

After the pointer table, the next page (approximately page 9 of the source listing) contains comments describing special codes which are used in the texts. A number of codes display commonly-used phrases -- for example, a byte containing 14 Hex displays "NAME OF FILE TO". The texts displayed by these special codes may be altered by changing WSMSG2.

Next, the actual texts begin. The menus are first. There is a wide and a narrow version of most of the menus; assembly of the unneeded width menus may be suppressed by setting WIDE or NARROW to zero as noted above. When changing menus, be sure to keep the narrow texts 63 displayable characters long or shorter, and don't make the wide texts longer than 79 characters. Also, for neat appearance when inverse video highlighting is in use, all lines in the same menu should be the same length.

Before the assembly language statements which produce each menu, the text of the menu is shown in comments. This reiteration is intended to produce an easily-readable copy of the text in the assembly listing.

Following the menus are numerous other texts, all identified by comments. Read the listing to see exactly what is there. Then there are several pages of texts for the help commands, followed by the text displayed if WordStar accesses a pointer in WSMSGS.OVR which does not point to some other text.

Additional "help" commands may be added by modifying WSMSGS.OVR and USER3 only; it is not necessary to modify other parts of WordStar. See discussion of this subject in the USER3 description above.

Additional information on procedures to modify WSMSGS is given in the next section.

WSMSG2: WSMSG2 contains the texts which are embedded in WS.COM, WSOVLY1.0VR, and MERGPRIN.0VR in order to permit display without the delay of a disk read, and/or to permit display even if WSMSGS.0VR is not available. WSMSG2 includes a number of short and frequently used texts, and texts used by many of the commands which are executed by code read in from one of the overlay files (WSOVLY1.0VR and MERGPRIN.0VR). In the latter case, the required code and text are read together from the overlay file, resulting in faster response than would occur if the code was read from the overlay file and the text was read from a separate messages file.

A special program, RETEXT.COM, is supplied on the <u>Customization Notes</u> diskette to embed the texts from an altered WSMSG2.COM into WSU.COM, WSOVLY1.OVR, and MERGPRIN.OVR (if present) at the proper places. RETEXT operation is detailed below.

Since a fixed amount of space is available at each text insertion point, a total length limit applies to each group of texts in WSMSG2.

At the beginning of WSMSG2.MAC there is an EQUate. When editing WSMSG2.MAC for reassembly, change this statement if necessary to match the system on which WSMSG2 is to be reloaded.

WordStar

The texts in WSMSG2.MAC are in groups, with a two-byte group length and self-pointers to all texts in the group preceding the texts in the group. The ordering of the groups and the group in which each text is placed are essential to RETEXT and WordStar operation. DO NOT REORDER THE GROUPS NOR MOVE TEXTS FROM GROUP TO GROUP.

Each group begins with a heading in a box of *'s, usually at the top of a page. The following is a prototypical group of three texts which we will use for purposes of explanation; each group in the WSMSG2.MAC source file is similar in structure. WSMSG2.MAC is listed at the end of the <u>Customization Notes</u> and is included on the diskette.

TEXTX - FOR OVERLAY #N (PART OF WSOVLYN.OVR)

TEXTS FOR MUMBLEDYFRATZ

THE VALUE ASSEMBLED INTO THE FOLLOWING DW SHOULD BE <= 99H

DW ETEXTX-\$; LENGTH OF THIS GROUP OF TEXTS

; SELF-RELATIVE POINTERS TO TEXTS IN THIS GROUP

DW TEXT1-\$

DW TEXT2-\$

DW TEXT3-\$

TEXT1: DB 'This is the message "TEXT1"',0

TEXT2: DB 'This is "TEXT2"',0

TEXT3: DB 'TEXT3',0

ETEXTX: ; MUST REMAIN AT END OF GROUP, AFTER ALL TEXT

The comment immediately below box of *'s may mean little to you -- this comments is intended for the programmers who create WordStar. The next comment, "THE VALUE . . . " is important to you: it indicates the maximum length this group may have.

The first code assembled in the group (the line DW ETEXTX-\$ in the above example) is the length of the group. This length word is essential to the operation of RETEXT, as well as allowing you to check that the length limit has not been exceeded. To check the length of a group after modification, make sure that the length value, which will appear in an assembly listing to the left of the DW ETEXT-\$, is less than or equal to the maximum specified in the comment line above the DW -- less than or equal to 99H in our example.

A group containing no texts is represented by a zero length count -- a DW 0 only. There are several of these in WSMSG2.MAC; they should not be disturbed.

After the length item, self-relative pointers to each text are assembled. Each consists of a statement of the form

DW XXXX-\$

where XXXX is a label defined at the beginning of the text. These pointers are used by WordStar to locate the texts in the group, allowing free alteration of the lengths of the texts (subject to the group length limit) and free rearrangement of the TEXTS within the group. DO NOT REARRANGE, REMOVE, OR ADD POINTERS.

If WSMSG2 is modified by reassembly, the assembler will automatically produce the correct pointer values. If WSMSG2 is modified by patching, the pointer must be adjusted for any text which is moved, and for any following texts within the group. Note that the contents of the pointer is relative to its own location (i.e., the number of bytes from the first byte of the pointer to the first byte of the text), and that the pointer is stored low order byte first.

After the pointers come the texts for the group. Each is of the form

XXXX: DB 'Message Text',0

where XXXX is the label used in the pointer to the message. Each text must end with a null (zero) byte. Within the text, special codes may be used, as in WSMSGS.MAC. Most texts are preceded by comments which explain their function. When looking for a specific text you wish to change, read these comments and/or search for one of the words in the text with WordStar's Find command.

All of the texts in a group must appear between the pointers and the end-of-group label. Do not attempt to make a pointer in one group point to a text in another group -- to do so would result in incorrect display after incorporation of the new WSMSG2 into WordStar. Provided all of all texts for a group are between the last pointer and the end-of-group label, the texts may be rearranged, intermingled, and point into each other however desired.

After all of the texts in a group is the end-of-group label, ETEXTX: in the above example. This must be the last thing in the group. Do not insert any text (or anything else but comments) between the end-of-group label and the beginning of the next group. The end-of-group label is used in assembling the length item (DW ETEXTX-\$ in our example). If the length item does not assemble to the exact number of bytes from its location to the location of the length item for the next group, RETEXT will not operate correctly.

Information on procedures for modifying WSMSG2 is given in the next section.

This section gives information on patching and/or reassembling and reloading the various modifiable modules. This section assumes you have already read the preceding module descriptions and determined the exact modifications you wish to make. It is especially important to read the foregoing descriptions of WSMSGS and WSMSG2 before attempting to understand the procedures here relating to those modules.

Patching USER2, USER3, and USER5

USER2, USER3, and USER5 appear in WS.COM (or other file name chosen during INSTALLation). They may be patched using the techniques described in the WordStar User's Guide (Sections 14 and 15) for patching USER1 and USER4. Either INSTALL's patcher or your debugger (DDT) may be used to effect patches. INSTALL's patcher recognizes all of the labels in USER1 through USER5. The code appears at the addresses shown in the assembly listings in normal systems; if you have a special WordStar version for a system with a TBASE other than 100 Hex, make the appropriate adjustment in the addresses.

Be sure to INSTALL WordStar as described in Section 14 of the <u>WordStar User's Guide</u> before patching, then make patches in the INSTALLed copy. WordStar will not run if it has not been INSTALLed. INSTALL stores into many items in USER5 if a daisy or similar printer is selected (thus possibly overwriting your patches) and may delete any code added to the end of WS.COM.

Patching the OEM Daisy Printer Driver

To patch the OEM daisy wheel and similar printer driver (POEM listing), it is necessary to patch WSOVLY1.0VR with DDT at locations 3A00 Hex less than the addresses shown in the POEM listing in these <u>Customization Notes</u>. It is NOT possible to patch the OEM daisy printer driver with INSTALL's patcher. The OEM daisy printer driver may be patched before or after WordStar is INSTALLed.

The POEM listing supplied is a partial listing of a portion of one of the modules combined by MicroPro to form WSOVLY1.0VR. The POEM code is read into RAM memory when printing on a daisy printer is initiated. The code does not appear in WSOVLY1.0VR at the same address at which it executes. Specifically, the code appears in WSOVLY1.0VR (when being patched with DDT in a system with TBASE=100 Hex) at addresses 220 hex and up, while it is executed (in a system with TBASE=100 Hex) at addresses 3C20 Hex and up (the addresses shown in the assembly listing). Thus, 3A00 Hex (3C20-220) must be subtracted from an address shown in the listing to obtain the corresponding address in WSOVLY1.0VR when patching with DDT. Similarly, 3A00 Hex must be added to the address at which an instruction or data area appears in DDT if this address is to be used in a JMP, STA, etc. instruction being entered into the POEM code.

For example, the instruction which appears at location 3C3F in the listing will appear at 23F when WSOVLY1.0VR is being patched with DDT. If you wanted to enter a JMP to the instruction which appears at 23F in DDT, you would enter JMP 3C3F.

(In special WordStar versions for TBASE values other than 100 Hex, the execution address for the POEM code is correspondingly changed. In addition, the POEM execution address may be increased an additional 100 Hex bytes in the special WordStars for the TRS-80 Model I and the Heath 89 with TBASE=4300 Hex. The relative location of POEM in WSOVLY1.0VR remains unchanged -- 120 Hex bytes from the beginning. In the unlikely event that you should wish to patch POEM in such a version, examine the addresses of the JMPs at the beginning of POEM in your WSOVLY1.0VR, and compare the values to those shown in the listing to determine the execution address.)

You may find it necessary to rename WSOVLY1.0VR to type .COM in order to permit reading the file into DDT.

Since (in most systems) the SAVE command will only produce a file of type .COM, you may need to rename the file resulting from SAVEing the patched code in order to re-establish the name and type WSOVLY1.0VR.

When making substantial changes to POEM, you may prefer to work with a source file. Create a source file containing the desired code, being sure that the locations of the JMPs and the constants (OEMLIM, OEMWID, and OEMPAG) on the first page of the listing match the listing. ORG the code at 3C20 Hex. Make sure the code does not extend beyond 3CBC or whatever the last address shown in the listing is. Assemble to produce a HEX file (this must be done using your operating system's assembler, not M80). Read the HEX file into DDT over WSOVLY1.OVR using an offset of -3A00, i.e. C600 Hex. Check that your new code appears in locations 220 Hex up.

After changing the OEM daisy printer driver and successfully testing WordStar using the modified WSOVLY1.0VR, be sure to remove all copies of the prior version from all diskettes which might be on-line when you intend to use the modified driver. Otherwise, WordStar may find the wrong copy of WSOVLY1.0VR and use the old driver (WordStar looks for WSOVLY1.0VR on both drive A and the logged drive, and the operator can change the logged drive at will).

Patching WSMSGS.OVR

Minor changes in the message text file WSMSGS.OVR (see preceding description) may be made readily by patching that file with DDT. WSMSGS.OVR is supplied with WordStar on the WordStar distribution diskette; no already-loaded copy of this file is supplied on the Customization Notes Diskette. To assist in finding texts and the pointers to them, you may wish to make an assembly listing using the source file (WSMSGS.MAC) supplied on the Customization Notes diskette.

To alter a text in WSMSGS.OVR without changing its length, as to make a menu reflect a change in command keys, find the desired text in WSMSGS, and patch it as desired. To shorten a text, move the following characters down, including the terminating null. To lengthen a text (by patching), move the text to the end of the file (extending the file as necessary, up to 32K), and locate the pointer to it in the area 180 hex - 300 hex and adjust the pointer to the new location of the text. When altering texts, be sure not to create lines longer than the screen width less 1.

After successfully changing WSMSGS.OVR and checking your changes, be sure to remove all copies of the prior version from your working diskettes. Otherwise, WordStar may find the wrong copy of WSMSGS.OVR and display the old texts (WordStar looks for WSMSGS.OVR on both drive A and the logged drive, and the operator can change the logged drive at will).

Assembling and Loading WSMSGS.OVR

Substantial changes in WSMSGS.OVR are most easily made by editing the source file WSMSGS.MAC (supplied on the Customization Notes diskette), then reassembling and reloading. Before editing WSMSGS.MAC, verify that the release number in a comment at the beginning of the WSMSGS.MAC file matches that in your WordStar's signon. When editing WSMSGS.MAC with WordStar, be sure to use the N (Non-document edit) command. To assemble and reload, you must have the MicroSoft assembler (M80) and loader (L80).

Using M80 and L80, the commands to assemble then load WSMSGS.OVR, with all files on the logged drive, are:

M80 = WSMSGS

L80 WSMSGS, WSMSGS.OVR/N/E

(Enterprising users might wish to convert the source file to be assembled with another assembler, rather than obtaining M80 and L80. Necessary changes might include removing or changing the "ASEG" pseudo-operation (which specifies absolute as opposed to relocateable assembly), removal of the "PAGE" pseudo-ops (which effect assembly listing formatting only), removal of form feed (control-L) characters (which effect listing (both source and assembly) format only), and renaming the file if type .MAC is not acceptable to the assembler. Of course, the loader that goes with the assembler must be used. After loading, the resulting file must be renamed to type .OVR if the loader produces a file of type .COM.)

If, when you invoke WordStar using the newly-loaded WSMSGS.OVR, the following or a similar message is displayed

*** WARNING: Wrong version of WSMSGS.OVR, some messages and menus may be wrong

then the Customization Notes diskette from which WSMSGS.MAC was obtained was for a different release of WordStar than the release of WordStar you are running. Check the release number in the WordStar signon, and in the WSMSGS.MAC source file, and locate matching versions or obtain an updated WordStar and/or Customization notes from your dealer or from MicroPro. Until the error is corrected, go back to using your prior version of WSMSGS.OVR. Do not operate with the wrong version of WSMSGS.OVR, as incorrect messages and

prompts might display and recently-added text might not be present.

WARNING: if you attempt to use a WSMSGS.COM file from a pre-2.0 WordStar-release in place of WSMSGS.OVR with WordStar 2.0 or newer, WordStar is likely to display garbage on the screen or crash. DO NOT USE PRE-2.0 WSMSGS with WordStar 2.0 or newer.

After successfully changing WSMSGS.OVR and checking your changes, remove all copies of the prior version from your working diskettes. Otherwise, WordStar may find the wrong copy of WSMSGS.OVR and display the old texts.

Patching and RETEXTing WSMSG2

Minor changes in the texts in WSMSG2 may be achieved by patching WSMSG2.COM with DDT then incorporating the changed messages in WordStar by running RETEXT.

The file WSMSG2.COM is not a file normally used by WordStar, but rather an intermediary that holds the texts between assembling / loading WSMSG2 and running RETEXT. However, for convenience in patching, a preassembled, pre-loaded WSMSG2.COM is supplied on the Customization Notes diskette.

Before patching WSMSG2.COM, we suggest making an assembly listing (using the WSMSG2.MAC source file supplied on the Customization Notes diskette) to assist in locating the texts, pointers, and group length items.

When patching WSMSG2.COM, any text may be altered in place (without increasing its length) by changing characters as desired. If the text is shortened, be sure to place a zero byte at the end. Texts within a "group" (see WSMSG2 description above) may be moved or rearranged if the self-relative pointers for the texts in that group are properly readjusted.

To make space to lengthen a text, the entire WSMSG2 file following that text may be copied to higher addresses, subject to the group's length limit. After making such a move, update the group's length item to reflect the length of the insertion, and update any pointers to following texts in the same group — add the number of bytes inserted to the present contents of the group length and of the appropriate pointers. It is not necessary to make any adjustments regarding following groups (groups moved in their entirety), as all pointers and lengths are relative to their own locations.

CAUTION: the "Move" commands in most debuggers do not work correctly if the move destination area overlaps the source area. Thus, to move the contents of a block of memory to addresses, say, two bytes higher, move the entire block to an entirely different area (e.g. beyond the end of WSMSG2.COM), then move it again from there to a destination two locations above the original source.

WordStar

After making the desired patches in WSMSG2.COM and SAVEing the patched version, run RETEXT: make sure the files WSU.COM, WSOVLY1.OVR, MERGPRIN.OVR (if you have the MailMerge option), and the patched WSMSG2.COM are on the current drive, then enter the command (for WordStar release 3.0)

RETEXT

RETEXT will incorporate the texts from WSMSG2.COM into WSU.COM, WSOVLY1.COM, and (if present) MERGPRIN.OVR. The file RETEXT.COM need not be on-line when the resulting WordStar is in use. See the heading "RETEXT Operation" below for additional information on RETEXT.

INSTALL must be run before some of the new texts (those embedded in WSU.COM) will appear during WordStar operation -- unless, of course, the "WSU.COM" file present during RETEXT execution was actually a renamed previously INSTALLed WordStar (see below).

Assembling, Loading and RETEXTing WSMSG2

Substantial changes in the texts in WSMSG2 are most easily made by editing the source file WSMSG2.MAC (supplied on the Customization Notes diskette), then reassembling, reloading, and RETEXTing.

Before editing WSMSG2.MAC, check that the release number at the beginning of the WSMSG2.MAC file matches that in your WordStar's signon. If it does not match, obtain an updated WordStar and/or <u>Customization Notes</u> from your dealer or from MicroPro. Use of mismatched releases may cause RETEXT to give an error and will in any case result in incorrect operation.

When editing WSMSG2.MAC (or any program source file) with WordStar, be sure to use the N (Non-document edit) command. To assemble and reload, you must have the MicroSoft assembler (M80) and loader (L80), as well as the program RETEXT.COM. (Alternately, the user may wish to attempt to convert WSMSG2.MAC to be assembled with a different assembler.)

If all files are on the current drive, the commands to assemble, load, and RETEXT WSMSG2 are:

M80 = WSMSG2

Uses file WSMSG2.MAC Produces file WSMSG2.REL

L80 WSMSG2, WSMSG2/N/E

Uses file WSMSG2.REL Produces file WSMSG2.COM

RETEXT

Uses WSMSG2.COM, WSU.COM, WSOVLY1.OVR, and (if present) MERGPRIN.OVR. Produces updated versions of WSU.COM, WSOVLY1.OVR, and (if present) MERGPRIN.OVR

RETEXT will incorporate the texts from WSMSG2.COM into WSU.COM, WSOVLY1.OVR, and (if present) MERGPRIN.OVR. The file RETEXT.COM need not be on-line when the resulting WordStar is in use. See the heading "RETEXT Operation" below for additional information on RETEXT.

RETEXT Operation

The program RETEXT, supplied on the Customization Notes diskette, is used to incorporate changed WSMSG2 texts into WordStar. As noted above, RETEXT must be run after patching WSMSG2.COM or after reassembling and reloading WSMSG2.MAC to produce a new WSMSG2.COM. This section gives additional information on RETEXT operation and error conditions.

RETEXT requires that the following files be on the current drive. There is no provision for accessing files on another drive, nor for alternate file names. If you are using a different name for any of the files, rename the file(s) before and after RETEXT execution.

WSMSG2.COM

(containing texts to incorporate)

WSU.COM

WSOVLY1.OVR

MERGPRIN.OVR

(optional)

If any of the files except MERGPRIN.OVR are not found, RETEXT will display an error message and abort. If MERGPRIN.OVR (the overlay file for the Merge-Print command, supplied with the MailMerge option) is absent, RETEXT will display an informational message and proceed.

If the WSMSG2.COM file is not for the same release of WordStar as the other files, RETEXT may display an error and abort. If RETEXT does not detect the error, incorrect operation or wrong texts may nevertheless result; thus, you should check carefully for matching releases (compare the WordStar signon and the comments at the beginning of the WSMSG2.MAC file) before editing WSMSG2.MAC and running RETEXT.

RETEXT inserts the groups of texts from WSMSG2.COM at the appropriate places in WSU.COM, WSOVLY1.OVR, and, if present, MERGPRIN.OVR. These files are updated in place; thus, you will want to keep backup copies on another diskette or under other file names.

If any of the "groups" of texts (see WSMSG2 description above) in WSMSG2.COM are longer than the space available for that group, RETEXT will display a message and proceed, leaving the old texts in WordStar for that entire group.

The file WSMSG2.COM is used only by RETEXT; there is no reason to have it online during WordStar execution.

The file WSU.COM present during RETEXT execution may be an uninstalled WordStar or a previously INSTALLed WordStar. To update 'texts in an already-INSTALLed WordStar, rename WS.COM (or whatever name was chosen at INSTALLation) to WSU.COM, run RETEXT, then rename back.

CAUTION: after using RETEXT, you may wish to use a different file name for the modified WordStar. If the WordStar was previously INSTALLed, be sure to run INSTALL again to change the name. If you merely rename the file, the R (Run program) command will not work because item FNWSCM in USER2 (described above) will not match the actual name of the WordStar .COM file.

After using RETEXT on an unINSTALLed WordStar (WSU.COM), you must of course INSTALL before the new versions of those texts which are inserted into WSU.COM will display during WordStar execution.

After successfully running RETEXT and checking all of the new texts (by entering whatever WordStar commands cause the texts to display), update all of the WS.COM, WSOVLY1.OVR, and MERGPRIN.OVR files on your working diskettes. Don't leave the old copies on some of the diskettes in active use, as WordStar might then occasionally find the wrong file and display the old texts (WordStar looks for all of these files on both drive A and the logged drive, and the operator can change the logged drive at will). Keeping backups of the old versions on an archive diskette is of course an excellent idea, in case a problem is later encountered with the new versions.

; **** FILE-EDITING COMMAND DISPATCH TABLE ****

; THIS TABLE IS USED TO INTERPRET COMMANDS INPUT : DURING EDITING OF A FILE. THE COMMAND CHARACTER ; PORTION OF THE ENTRIES MAY BE ALTERED TO CHANGE THE KEYS USED FOR COMMANDS.

: COMMANDS MAY BE FREELY CHANGED BETWEEN SINGLE AND ; DOUBLE KEYSTROKES, OR TO A DIFFERENT PREFIX (FIRST KEY) ; FOR A TWO-KEYSTROKE COMMAND. HOWEVER, THE SAME KEY ; MAY NOT BE USED BOTH AS A SINGLE-KEY COMMAND AND AS ; THE FIRST (PREFIX) KEY OF TWO-KEY COMMANDS.

; DUPLICATE ENTRIES ARE OK: YOU MAY ADD A NEW KEY OR ; KEY PAIR FOR AN EXISTING FUNCTION, WITHOUT DELETING THE ; OLD COMMAND, USING THE EXTRA SPACE PROVIDED AT THE END.

: EACH TABLE ENTRY CONSISTS OF FOUR BYTES:

BYTE Ø: (FIRST) COMMAND CHARACTER.

BYTE 1: ZERO FOR ONE-KEY COMMANDS, OR SECOND

CHARACTER OF TWO-KEY COMMANDS.

BYTES 3,4: ADDRESS, DO NOT ALTER; OR,

IF VALUE LESS THAN 256, IT IS THE INDEX

(SEE WSMSGS.OVR) TO A TEXT STRING

TO DISPLAY, FOR A "HELP" COMMAND.

; THE LAST ENTRY IS FOLLOWED BY A ZERO.

COMMAND CHARACTERS IN THE FIRST BYTE OF EACH TABLE ENTRY SHOULD BE BE CONTROL CODES (Ø1-3F HEX), AS ONLY CODES NOT IN THE TABLE ARE TAKEN AS TEXT TO BE ENTERED IN THE FILE.

THE SECOND CHARACTER CAN BE ANY CHARACTER EXCEPT A LOWER CASE LETTER. THE EDITOR DISREGARDS BIT 1 (40 HEX) WHEN MATCHING THE SECOND KEYSTROKE AGAINST THE TABLE ENTRY, SO THAT CONTROL CHARACTERS AND LETTERS ARE EQUIVALENT. LOWER CASE LETTERS ENTERED AS THE SECOND KEYSTROKE OF A COMMAND ARE CONVERTED TO UPPER BEFORE THE TABLE SEARCH.

: TABLE BEGINS ON NEXT PAGE

; EDITING COMMAND DISPATCH TABLE...

**** EXPANSION SPACE ****

; REDUNDANT ENTRIES USING YOUR FAVORITE KEYS MAY
;BE ENTERED IN THE FOLLOWING SPACES IF YOU WISH TO KEEP
;THE ORIGINAL ENTRY SO THE ORIGINAL KEYS STILL OPERATE.
; IN CREATING ADDITIONAL ENTRIES, COPY THE ADDRESS
;PORTION CAREFULLY FROM THE ENTRY ABOVE FOR THE DESIRED
;FUNCTION. SEE DESCRIPTION OF ENTRY FORMAT, ABOVE.
; USE THE SPACES FROM THE FIRST ONE FORWARD, AS THE
;FIRST ENTRY WITH A ZERO IN ITS FIRST BYTE ENDS TABLE.
; ADDITIONAL "HELP" COMMANDS MAY BE ADDED BY
;PATCHING IN AN ENTRY HERE AND MODIFYING THE DISK TEXT
;FILE, WSMSGS.OVR. THE THIRD BYTE IN THE ENTRY SHOULD
;BE THE INDEX (NUMBER OF BYTES) INTO THE POINTER TABLE
;AT BEGINNING OF WSMSGS.OVR (SEE SAME) FOR THE ADDED

; CHANGED BY MODIFYING WSMSGS.OVR (SEE SAME).
; THE INSTALL PROGRAM MAY USE SOME OF THESE SPACES
; FOR SPECIAL CURSOR CONTROL KEYS FOR SOME TERMINALS,
; SO LOCATE A SPACE THAT IS STILL Ø IN YOUR INSTALLED
; WORDSTAR BEFORE PATCHING.

;TEXT; FOURTH BYTE SHOULD BE ZERO. MENUS CAN ALSO BE

** OEM PARALLEL DAISY WHEEL PRINTER DRIVER **

WodStar 3.0, July 23rd, 1981

CALLED ONLY IF CSWITCH=3. IF USED, HAVBSY SHOULD :BE FF. POSMTH IS ASSUMED 1 IF CSWTCH IS 3.

THESE PRINTERS USE 3 PORTS AND AN HAVE AN ENTIRELY DIFFERENT INTERFACE THAN ANY OF THE OTHER PRINTERS :SUPPORTED FOR BY WORDSTAR.

THUS, THIS DRIVER HAS DIFFERENT ENTRY POINTS THAN THE OTHER PRINTER DRIVERS; NONE OF THE USUAL PATCH STRINGS ; ARE USED; EVERTHING IS DONE VIA ENTRIES ON THIS PAGE. ALL OF THESE ENTRIES RETURN CY=1 IF THE PRINTER IS :BUSY: CALLER RECALLS (EDITING BETWEEN CALLS IF A FILE ; IS BEING EDITED) UNTIL CY=0 IS RETURNED.

OEM DAISY DRIVER IS READ IN FROM OVERLAY FILE 1 ; WHEN NEEDED. LOCATIONS AT WHICH CODE APPEARS IN OVERLAY ;FILE ARE NOT THE LOCATIONS IT RUNS AT. LOCATIONS SHOWN ; IN LISTING ARE EXECUTION LOCATIONS; LOCATIONS IN OVERLAY :FILE ARE DIFFERENT.

TITLE WSMSGS Ø5/10/81 *3.0* WORDSTAR DISK TEXTS (WSMSGS.OVR); ASSEMBLED AND LOADED SEPARATELY.

; FOR WordStar RELEASE 3.0 , MAY, 1981

; ASSEMBLY PARAMETERS RELATING TO CUSTOMIZATION - FOR USER AND MICROPRO USE

; TBASE - WHERE PROGRAMS LOAD UNDER CP/M - 100H EXCEPT IN SPECIAL VERSIONS ; FOR COMPUTERS WITH MEMORY AT LOW ADDRESSES DEDICATED TO OTHER PURPOSES,

; SUCH AS THE TRS-80 MOD 1 OR THE HEATH H-9 (CP/M IS A TRADEMARK OF DIGITAL RESEARCH).

;TWO TBASE'S ARE DEFINED:

; TBASE1 MUST MATCH SYSTEM IN WHICH WORDSTAR WILL RUN.

; TBASE2 MUST MATCH SYSTEM IN WHICH WSMSGS IS LOADED, IF DIFFERENT.

TBASE1 EQU 100H ; TBASE FOR TARGET SYSTEM. DETERMINES BOOT (LOCATION

;TO JMP TO TO EXIT A PROGRAM) AND ADDRESS AT WHICH

; MESSAGE CODE (THIS FILE) EXPECTS WORDSTAR'S ABSOLUTE-; LOCATION FLAGS TO BE.

TBASE2 EQU 100H ; TBASE FOR DEVELOPMENT SYSTEM - SAME AS TBASE1 UNLESS

; WSMSGS IS TO BE LOADED ON A DIFFERENT SYSTEM THAN IT

; IS TO BE RUN ON. DETERMINES ORIGIN AT WHICH LOADER

; LOADS THIS FILE, ONLY.

BOOT EQU TBASE1-100H ; JMP ADDRESS TO REBOOT OPERATING SYSTEM.

; WIDE AND NARROW SCREEN SUPPORT.

WSMSGS USUALLY CONTAINS TWO COPIES OF MANY MENUS: ONE FOR NARROW SCREENS,

; ONE FOR WIDE SCREENS. BY CHANGING THE FOLLOWING PARAMATERS, THE USER MAY

; GENERATE A SHORTER WSMSGS.OVR FILE CONTAINING ONLY THE MESSAGES NEEDED

; FOR HIS SCREEN WIDTH.

; VERSIONS OF WORDSTAR RELEASED FOR SPECIFIC SYSTEMS MAY ALREADY HAVE THE

; MESSAGES FOR THE UNNEEDED SCREEN WIDTH REMOVED.

WIDE EQU Ø ;-1 TO INCLUDE TEXTS FOR SCREENS 80 OR MORE COLUMNS

; WIDE, Ø TO OMIT.

NARROW EQU -1 ;-1 TO INCLUDE TEXTS FOR SCREENS 64 TO 79 COLUMNS WIDE,

; Ø TO OMIT.

****** SPECIAL CHARACTER CODES ****

THE FOLLOWING CODES ARE INTERPRETED FROM WITHIN THE "TEXT" IN THIS FILE.

TERMINATES TEXT

DISPLAYS " on (OFF)" FOR Z, OR " off (ON)" FOR NZ, PER FLAG IN Ø5H NEXT 2 BYTES (DW ADDRESS) USED TO PRINT O MENU ITEMS.

TAB - TABS TO NEXT MULTIPLE OF 8 COLUMNS, AS USUAL.

MUCH USED IN TEXT - ENTERED AS TAB WITHIN QUOTED AREA.

LINE FEED (LF) AS USUAL ØA

ØD CARRIAGE RETURN (CR) AS USUAL

ØEH ERASE TO EOL, CR, LF

ØFH CR, LF

1ØH DISPLAYS "ERROR"

11H DISPLAYS " INTERNAL ERROR"

DISPLAYS "FATAL" 12H

13H DISPLAYS INDENT FOR PROMPTS: 3 INVERSE (INVERSE) VIDEO SPACES

14H DISPLAYS " NAME OF FILE TO "

15H DISPLAYS "FILE"

16H DISPLAYS "MERGE-" IF MERGE-PRINT

17H DISPLAYS "Print a file ", "STOP PRINT ",OR "CONTINUE PRINT" FOR P= ITEMS ON NO-FILE MENU, 'K MENU.

ERASES TO END LINE. AWAITS KEYSTROKE (UPDATING FILE DISPLAY 18H AREA WHILE WAITING), THEN CONTINUES OUTPUT AT TOP SCRN. USED BETWEEN FRAMES AND AT END OF HELP EXPLANATIONS.

DISPLAYS NAME OF LAST NOT-FOUND FILE, W/O DRIVE

19H 1AH DISPLAYS NAME OF LAST NOT-FOUND FILE, OR OTHER CALLER-SET FCB
